## 1. Introduction

---

### 1.1. Credentials

- (1) I am an economist and Managing Director with Intensity, a Secretariat company (“Intensity”),<sup>1</sup> based in Dallas, TX. I have been employed by Intensity since January 2021. Until December 31, 2020, I was an economist and Vice President with Charles River Associates, Inc. (“CRAI”); I joined CRAI in June 2015. Prior to my employment at CRAI, I was a Managing Director and head of the economics practice with Alvarez & Marsal Global Forensics and Disputes (“A&M-GFD”), based in New York, NY. I was employed by A&M-GFD from December 2011 until June 2015. Before joining A&M-GFD, I was an economist and Senior Vice President (final title) with NERA Economic Consulting (“NERA”), based in White Plains, NY. I began working at NERA in July 1984.
- (2) I received my Bachelor’s Degree from Wesleyan University (Middletown, CT) in 1976. I graduated *cum laude* and with Departmental Honors in Economics. I earned my M.A. and Ph.D. degrees in Economics from the University of Maryland (College Park, MD) in 1978 and 1980, respectively. After I completed my graduate studies, I served as a member of the economics faculty at Miami University (Oxford, OH) from 1980–1984. My complete educational and employment history is set forth in my CV, attached to this report as Attachment A-1. My CV contains a list of all publications I have authored in the past 10 years and a list of all cases in which, during the past 4 years, I have testified as an expert at trial or by deposition.

### 1.2. Nature of engagement and assignment

- (3) Intensity has been retained by Plaintiffs’ Counsel on behalf of Wolfire Games, LLC (“Wolfire”), Dark Catt Studios Holdings, Inc. (“DCS Holdings”), Dark Catt Studios Interactive LLC (“DCS Interactive”) (together with DCS Holdings, “Dark Catt”), and a putative class of Plaintiffs (together, “Plaintiffs”) in the above-captioned litigation against Valve Corporation (“Valve”). The putative class is defined as follows:<sup>2</sup>

---

<sup>1</sup> On February 1, 2023, Intensity, LLC was acquired by Secretariat International and began operating as Intensity, a Secretariat Company. On January 1, 2024, my employment was transferred to Secretariat Advisors; for now, Intensity continues to operate as Intensity, a Secretariat Company. That is likely to change during the first or second quarters of 2024, at which point Intensity will operate as Secretariat Advisors.

<sup>2</sup> Consolidated Second Amended Class Action Complaint, 3/23/2023, ¶ 375.

All persons or entities who, directly or through an agent, paid a commission to Valve in connection with the sale or use of a game on the Steam platform on or after January 28, 2017, and continuing through the present until the effects of its scheme are eliminated (the “Class Period”), and where either (1) the person or entity was based in the United States and its territories or (2) the game was purchased or acquired by a United States-based consumer during the Class Period. Excluded from the Class are (a) Defendant, its parents, subsidiaries, affiliate entities, and employees, and (b) the Court and its personnel.

- (4) The putative class members in this case are those who directly paid commissions (referred to as revenue share by Valve<sup>3</sup>) to Valve. In many cases, these are game publishers. Game publishers support game developers by providing funding for game developers to bring creative visions to life, distributing developed games on platforms like Steam and Epic Games Store, and assisting in developing strategies for monetization of games through downloadable content and microtransactions.<sup>4</sup> Game developers are persons or organizations that create a game’s storyline and look, while “programmers within the organization write the code and create the artwork to implement the developer’s vision behind the game.”<sup>5</sup> Sometimes, a single entity assumes both the game publisher and developer roles.<sup>6</sup>
- (5) I was asked to evaluate and, if called upon, to testify concerning the following three issues:
- Are economic methodologies available to define an appropriate relevant market and assess Valve’s market power in that relevant market?
  - Are there economic methodologies that can be used to demonstrate the class-wide impact of Valve’s conduct on putative class members?

(“In the PC gaming industry, the ‘developer’ is typically the entity that creates the game while the entity that markets the game is typically referred to as the game ‘publisher.’ Sometimes a single company undertakes both of these functions.”)

- Are economic methodologies available to calculate class-wide damages?

- (6) As detailed herein, I conclude the answer to all three questions is yes.
- (7) Intensity is currently being compensated at a rate of \$1,100 per hour for my work in this matter. Prior to January 2024, Intensity was compensated at an hourly rate of \$1,050. Intensity is being compensated for time spent by others on my team at rates that are lower than my hourly rate. Intensity’s compensation is not dependent on either my conclusions, the substance of my testimony, or the outcome of this matter.

### **1.3. Overview of materials considered**

- (8) In carrying out my assignment, I considered and relied upon my education, professional background and experience and, as well, the documents and data cited throughout this report and the accompanying exhibits. In forming my opinions, I, and members of my team working under my supervision and direction reviewed documents and data produced by both parties in discovery, deposition testimony, and the expert reports, and written testimony.<sup>7</sup> I held discussions with Dr. Joost Rietveld, Ph.D., Associate Professor at University College London School of Management; David Rosen, CEO and Lead Programmer at Wolfire Games; and John Robb, CEO at Dark Catt Studios. I have also considered documents and other materials, which are cited herein and/or listed in Attachment A-2.
- (9) My analysis is ongoing, and my conclusions are based on information currently available to me. If any additional information or testimony—including from any of the experts in this matter—becomes available to me, I reserve the right to consider such information or testimony and to supplement this report and my opinions, as appropriate. I also reserve the right to supplement my report in light of any additional fact discovery, analysis and opinions set forth by other experts, and/or trial testimony, and to respond to other experts and the testimony of any fact witnesses.
- (10) In addition, should I be asked to testify to my opinions at the trial of this matter, I reserve the right to prepare exhibits that summarize portions of my analysis and my opinions and to prepare demonstrative exhibits that help to explain elements of my analysis and opinions. I have not yet selected any exhibits I may ultimately use. In addition, I reserve the right to use

<sup>7</sup> In the discussion that follows describing the analytical process or materials reviewed, references to “I” should be interpreted as referring to me and members of my team working under my supervision and direction.

animations, demonstratives, enlargements of actual attachments, and other information in order to convey my opinions.

- (11) The entirety of my report, including attachments and referenced/considered materials, provides the basis for my analysis and conclusions. The organizational structure of the report is for convenience. To the extent that facts, economic analysis, and other considerations overlap, I generally discuss such issues only once for the sake of brevity. Neither the specific order in which each issue is addressed nor the organization of my report or attachments affects the ultimate outcome of my analysis.

---

## 2. Summary of Conclusions

---

- (12) In the report below, I present my analysis and conclusions. A summary of some of my principal conclusions is set forth here.
- a. Valve’s pricing and content policies function as a platform most favored nation policy (“PMFN Policy”). Valve enforces the PMFN on both pricing and content, including by delisting titles from Steam that do not adhere to the PMFN Policy.
  - b. The relevant antitrust market for purposes of my analysis is a worldwide market for third-party digital PC game distribution via platforms.
  - c. Valve has monopoly power in the relevant market, evidenced by its high and sustained market share, high and sustained profitability, and Valve-imposed barriers to entry to the market through the PMFN Policy, all of which allow Valve to charge a supracompetitive rate to publishers. Valve’s monopoly power harms competition in the market, including through its ability to set and sustain that supracompetitive price to publishers, deter entry and/or reduce the competitiveness of potential platforms, and reduce the variety, choice, and innovation in the market.
  - d. Valve’s exercise of its monopoly power—through its enforcement of the Steam PMFN Policy—has harmed and continues to harm competition in the market, by enabling Valve to set and sustain supracompetitive prices, reduce output, and reduce variety, choice, and innovation in the market.
  - e. Valve’s exercise and maintenance of its monopoly power has harmed and continues to harm putative class members, *i.e.*, the publishers listing their games on Steam.
  - f. Absent the PMFN Policy, vigorous competition would exist within the market, leading to lower, more competitive commission rates for all or virtually all class members. This conclusion is supported by analyses based on several different analytical methods, including: (1) my Platform Competition Model, (2) my yardstick analysis, and (3) my empirical analysis. My Landes and Posner model—used for damages—further confirms my conclusion that all or virtually all class members are harmed.
  - g. Absent the PMFN Policy, the lower commission rates would result in publishers passing through some savings from the lower commission rates to consumers in the form of lower game prices. Lower fees to publishers and lower prices to users result in a net lower price across the platform.
  - h. Absent the PMFN Policy, the but-for commission rate would be 17.7%, resulting in class-wide damages of between \$2.9 billion and \$3.1 billion.
  - i. The issues I analyze in this case can be analyzed using evidence common across putative class members. In particular, damages from the commission overcharge can be calculated in a formulaic way using standard economic approaches that rely on evidence common to the putative class.

## 3. Background

### 3.1. Overview

- (13) In this section, I introduce several industry and market concepts that are relevant throughout my report. I start with an overview of video games and then discuss the distribution of PC games—the type of video game most relevant to this case. I also discuss the Steam platform, which is at issue in this case, Steam’s content and price parity policies, and the effects of those parity policies on the putative class.

### 3.2. Video games

- (14) A video game is an “electronic or computerized game” that displays images on a screen when the game is being played.<sup>8</sup> Beside the visual display, video games use “other systems to provide interaction and information to the player[.]” including sound through speakers and vibration.<sup>9</sup> Modern video games have a combination of “3D art, computer-generated effects, architecture, artificial intelligence (AI), sound effects, dramatic performances, music, storytelling, and, most importantly, interactivity.”<sup>10</sup> This interactivity enables video game players to explore a range of different environments such as “simulated reality” and “artistic expressions[.]”<sup>11</sup> Video games are played on personal computers (“PC”), hand-held devices, such as the Nintendo Switch Lite and Sony’s PlayStation Portal, and consoles, including Sony’s PlayStation and Microsoft’s Xbox.<sup>12</sup>

- (15) Video games are categorized into genres based on “factors such as method of game play, types of goals, and more.”<sup>13</sup> Valve categorizes games on Steam as: Action, Adventure, Arcade, Card, Casual, Early Access, Free-to-play, Family, First-person shooter, Indie, Massively multiplayer online, Platformer, Puzzle, Role-playing game, Real-time strategy, Simulation, Sports, and Strategy.<sup>14</sup>

### 3.2.1. History and overview of video game industry

- (16) There are several ways for users to play a video game. PC gaming includes games that are designed for and played on PCs.<sup>15</sup> These games typically cannot be played on other devices such as consoles and mobile devices unless the user purchases a second copy/version that is compatible with the non-PC device.<sup>16</sup> PC games are played on both laptop and desktop computers and on various operating systems (*e.g.*, Windows, MacOS, Linux).<sup>17</sup>

They are Microsoft Windows, Linux, and Mac OS.”)

### 3.2.2. PC gaming distribution

- (17) Initially, PC games were distributed using physical media, such as floppy disks or CD-ROMs.<sup>18</sup> Physical PC games were especially popular in the mid to late-1990s.<sup>19</sup> Released in 1994, *Myst* was the first CD-ROM game to sell in excess of one million copies and has been credited with driving the adoption of CD-ROMs as a gaming medium.<sup>20</sup> Physical PC game sales have declined significantly since 1996, falling from 41% to just 6% of console and PC physical game sales in 2016.<sup>21</sup>
- (18) Today, digital distribution dominates the PC game market.<sup>22</sup> In 2014, DFC Intelligence, a market research company, reported that, globally, approximately 92% of PC games sold were distributed digitally.<sup>23</sup> In 2020, 98% of total sales revenue for the global PC gaming industry came from digital PC game sales.<sup>24</sup> Data from PwC show that in the US PC gaming market, physical PC game sell-through revenue has declined whereas digital PC game sell-through revenue has increased.<sup>25</sup>

(22) According to Mr. Lynch, physical distribution is also more costly and complicated than digital.<sup>39</sup> For example, physical distributors have to “put the game on a piece of plastic, CD-ROM, DVD, and then [they’ve] got to put it in a box and make it in a factory. And then [they] have to ship those boxes to all over the world. Eventually they have to get onto store shelves. Then [they] have to kind of make sure those store shelves are kind of organized and they’re doing a good job in terms of presentation. [They] have to worry about the inventory kind of

being there in all the different stores when people go there and being out of inventory.”<sup>40</sup> Publishers also perceive the two distribution modes as different, because for digital distribution, they just “put [their] games up online[,]” but they go through a different process for physical distribution.<sup>41</sup>

### 3.2.3. PC game developers and publishers<sup>42</sup>

- (23) PC video games that can be downloaded or played online are created by game developers.<sup>43</sup> Game developers are responsible for “designing, creating, and bringing video games to life.”<sup>44</sup> According to Game Developers Conference’s (“GDC’s”) 2023 survey, 65% of video game developers develop PC games.<sup>45</sup>
- (24) There are three common types of developers: indie, large-scale, and third-party.<sup>46</sup> Indie developers usually consist of teams of 1–100 individuals that work on smaller games, with a single or limited portfolio of games.<sup>47</sup> Large-scale developers, sometimes referred to as AAA or Triple-A,<sup>48</sup> consist of teams of hundreds of individuals that work on different games for multiple platforms; examples of such Triple-A developers include Riot Games (“Riot”), Epic Games (“Epic”), and Activision Blizzard.<sup>49</sup> Third-party developers are contracted by video game

I mean, it’s a different process to, you know, put your game up online versus, you know, going through the process of, you know, retail distribution, yeah.”)

<sup>42</sup> As will be discussed in this section, the game “developer” and game “publisher” serve different functions, whether those functions are accomplished by a single entity or multiple ones, that is sometimes a single company undertakes both functions. In this report, the terms are used interchangeably (unless otherwise noted) to describe the entity that is actually paying the Steam commissions to Valve and are part of the putative class.

publishers to develop games, as publishers may conceive of games “but have priorities elsewhere.”<sup>50</sup> In such an arrangement, the publisher “determines the game’s goals, and creative control is never fully given to the developer.”<sup>51</sup>

- (25) Game publishers are the entities that actually bring games to the market for users to play.<sup>52</sup> Game publishers include Valve, Activision Blizzard, Electronic Arts (“EA”), and Ubisoft, all of which also operate digital platforms and develop games.<sup>53</sup> Some game developers do not have the resources to also publish games, as that requires the ability “to produce, deliver, and support a game all on their own servers.”<sup>54</sup> Testimony from Dark Catt employee<sup>55</sup> Jason Owens also indicates that financial constraints may prevent small developers from publishing their own games.<sup>56</sup>
- (26) Game publishers support game developers by providing funding that allows game developers to create the games. Publishers may also generate funding for developers by distributing developed games on platforms like Steam and Epic Games Store (“EGS”).<sup>57</sup> Publishers also assist in monetization of games through downloadable content and in-game advertising.<sup>58</sup> The relationship between developer and publisher is symbiotic. A game developer benefits from a game publisher’s “financial support, marketing expertise, and distribution channels[,]” while the publisher relies on the developer’s creativity and technical expertise to create “compelling

and marketable games.”<sup>59</sup> Sometimes, a single company undertakes both the game publisher and developer roles.<sup>60</sup> A publisher can create an in-house development team to develop games,<sup>61</sup> as in the case of Annapurna Interactive, a game publisher that created an internal development studio in 2022 to develop games.<sup>62</sup>

- (27) Publishers may also distribute games through their own proprietary website. One prominent example of a publisher/developer that sells games directly to consumers via its own website is Blizzard, who merged with Activision in 2008 to create Activision Blizzard.<sup>63</sup> Blizzard developed popular titles such as *World of Warcraft*, *Overwatch*, *Diablo*, and *StarCraft*.<sup>64</sup> The company has historically offered its PC games exclusively through its *Battle.net* platform (although the company recently announced that, as of August 10, 2023, the company would distribute on Steam for the first time).<sup>65</sup> Some developers distribute their games both through their own platforms and non-proprietary platforms like Steam. For example, CD Projekt, makers of *The Witcher* series and *Cyberpunk 2077*, offer games both through their own GOG platform<sup>66</sup> and through Steam.<sup>67</sup>

- (30) Steam is a platform. Economists define a platform as an entity that facilitates interaction between one or more groups of users, like consumers and producers.<sup>75</sup> Here, Steam connects game publishers/developers to game players, facilitating transactions between the two. Digital platforms, like Steam, take the form of “website[s], app[s] or other digital venue[s] that interact commercially with one or more group of users.”<sup>76</sup> While platforms that connect groups of users directly to people like them are called “one-sided” or “single-sided” platforms, platforms such as Steam, that connect two or more different groups of users in a physical or virtual space are called two-sided or multi-sided platforms.<sup>77</sup> Platforms often exhibit network effects. Economists define network effects as an attribute of a product or platform, in which the product or platform’s value changes as the number of users of that product or platform changes.<sup>78</sup> “Direct” or “same-side” network effects exist if, as more users join a platform, the

(40) Valve’s curated marketing opportunities are important to developers as they boost a game’s visibility on Steam and drive game revenue.<sup>134</sup> For example, in an email to a developer, a Valve employee states: “[T]akeovers represent what is by far the biggest marketing exposure available on Steam—each takeover generates between [REDACTED] impressions.”<sup>135</sup> As another example, an internal Valve presentation demonstrates that [REDACTED] 2018 free weekends resulted in [REDACTED] impressions that generated [REDACTED] in revenue.<sup>136</sup>

(41) Valve also offers algorithmic marketing on Steam. Algorithmic marketing offers personalized visibility to users.<sup>137</sup> According to Valve, Steam “automatically customizes elements of the store for every user[,]” so there is “no one algorithm.”<sup>138</sup> Steam’s “algorithms” respond to player preferences and interests.<sup>139</sup> Hence, Steam is personalized for users, letting “player

In this slide, we had called them Midweek Madnesses, but we have updated our terminology, so midweek deals and weekend deals. Q. Are these opportunities that developers request, and then the business development team either gives it to them or does not? A. There are partners who will reach out and want to coordinate a promotion and see if a midweek or a weekend deal fits their timing. Additionally, there are games that we reach out to and say, your game has a lot of customer interest. Is this something you might be interested in? Q. And do you find that developers treat an opportunity for their game to be in the spotlight as something that’s quite positive to their marketing efforts? A. A midweek or a weekend deal are more than just being in the spotlight. So it’s part of one of the curated marketing things that happens in those two particular promotions.”)

to Mr. Lynch, Valve's commission charged to the majority of publishers was 30% for sales made through the Steam Store until 2018.<sup>144</sup>

- (43) Valve initially set its commission rate to be consistent with brick-and-mortar retailers.<sup>145</sup> This allowed it to generate high profits on Steam because, as I noted above, costs for digital sales are materially lower than for brick-and-mortar distribution.
- (44) In late 2018, Valve modified its commission system and implemented a tiered structure.<sup>146</sup> For the first \$10 million in total revenue for a particular game (starting from October 1, 2018), Valve charged a 30% commission.<sup>147</sup> For all game revenue greater than \$10 million and less than \$50 million, Valve's commission dropped to 25%.<sup>148</sup> For all game revenue over \$50

## 4. Relevant Market Definition and Monopoly Power

---

(48) I understand that one of the elements that the putative class plaintiffs need to establish is that Valve has market power in the relevant market. In this section, I apply economic principles to determine the product and geographic dimensions of the relevant product market. I conclude that the relevant product market in this matter is the market for third-party digital PC game distribution via platforms and the relevant geographic market is worldwide. I then demonstrate that Valve has market power in the relevant market.

### 4.1. Defining the relevant market

#### 4.1.1. Implementing the HMT/SSNIP and *Brown Shoe* factors

(49) In economics, a market is an environment in which buyers and sellers interact for the purpose of buying and selling goods and/or services and in which the terms and conditions of trade are established, including the price at which the exchange will take place.<sup>160</sup> Firms often compete in many markets; however, which of those markets is relevant to the issues being considered and constitutes a relevant antitrust market is a subject for analysis (“relevant market”). A relevant market “is composed of products that have reasonable interchangeability for the purposes for which they are produced—price, use and qualities considered.”<sup>161</sup> Put differently, a relevant market includes the set of products to which consumers can turn as reasonable economic substitutes when the relative prices of goods change.

(50) Defining a relevant market involves analyzing two components: (a) the product dimension and (b) the geographic dimension.<sup>162</sup> As noted herein, the product dimension includes products that are reasonable substitutes for one another within the market and are related to the plaintiffs’ claims.<sup>163</sup> Products are economic substitutes if an increase in the price of one

For purposes of this report, I adopt the usual convention of referring to these as the product market and the geographic market.

<sup>163</sup> *FTC v. Qualcomm Inc.*, No. 5:17-cv-00220-LHK, Proposed Findings of Fact, at ¶¶ 71–72 (N.D. Cal. 2019). (“The starting place for defining a relevant market is a reference product— a product or a set of products that is offered by the firm that

product, Product B, increases quantity demanded for the other product, Product A.<sup>164</sup> The percentage change in quantity demanded of Product A for a given percentage change in the price of Product B is the cross-price elasticity of demand—a metric used to determine the level of substitutability between two products.<sup>165</sup> The relevant geographic market includes all the geographic areas to which consumers can reasonably turn for the product at issue.<sup>166</sup> While a particular good or service might be available in a wide geographic area, the geographic market that is relevant to an antitrust inquiry only encompasses the areas to which customers might reasonably turn to acquire those goods or services if prices change.

- (51) The goal of a market definition analysis is to define the set of products and geographies within which competition occurs for the products at issue.<sup>167</sup> One approach to market definition is to analyze the seven “*Brown Shoe* factors,” associated with the Supreme Court’s 1962 decision in *Brown Shoe Co. v. United States*.<sup>168</sup> There, the court laid out seven “practical indicia” that

engaged in the anticompetitive conduct. The selection of the candidate market does not, however, change the test or pre-determine the outcome.”)

(“To determine whether monopoly power exists, it is necessary to define the relevant market in which the power over price or competition is to be appraised. ... The boundaries of a relevant product market are determined principally by the reasonable interchangeability of use of the products; products that are reasonably interchangeable in use generally compete with each other and are thus part of the same market.”)

(“Changes in the price of related goods also affect demand. Goods are substitutes when an increase in the price of one leads to an increase in the quantity demanded of the other.”)

<sup>165</sup> Just because a very large price increase in one product creates a small increase in demand for the other product does not necessarily mean that the two products are in the same market. Products that are not sufficiently comparable are, thus, not included in the relevant market, either due to product attributes, perceptions, or geography.

- (52) One common analytical tool that is used to define relevant markets in merger analysis is the Department of Justice’s and Federal Trade Commission’s Hypothetical Monopolist Test (“HMT”). The HMT considers a small but significant non-transitory increase in price (“SSNIP”) of the product at issue and defines the relevant market as that in which a hypothetical monopolist could profitably impose a SSNIP.<sup>172</sup> The SSNIP test captures economic

considerations of substitutability by considering potential substitution among competing products following the small, non-transitory change in price. The Merger Guidelines suggest the consecutive application of the HMT to define the relevant product market and then again to define the relevant geographic market.<sup>173</sup>

- (53) The HMT/SSNIP test is difficult to implement quantitatively, in general. I do not conduct a quantitative SSNIP test in connection with my analysis of the relevant market; instead, I draw upon the concept of reasonably substitutable products underlying the SSNIP test and that is at the heart of the relevant market analysis, as set forth in *Brown Shoe*. In defining the relevant market in this matter, I focus on the fundamental question in market definition analysis: what is the set of products to which customers can and do readily turn as reasonable substitutes for the product at issue? In other words, “[a]lthough courts and antitrust enforcement agencies consider a range of factors, the single most important consideration in antitrust relevant market definition is the consumer’s ability and propensity to substitute one product for another.”<sup>174</sup>
- (54) In a case where economists can observe changes in relative prices between two (potentially substitutable) products, observing consumer behavior, specifically changes over time in purchasing behavior, can provide insights into the extent to which those two products are substitutable and, sometimes, the strength of that substitution relationship.
- (55) One economically reasonable approach to determining substitutability is to examine consumer substitution at the borders of a candidate market and to analyze how entry by various types of potential competitors into that market affects the performance (and behavior) of an incumbent.<sup>175</sup> This entry can function as a “natural experiment” that may identify purchasing patterns between candidate goods.<sup>176</sup> If an incumbent firm is impacted by a new entrant, or reacts to that entity’s entrance, this is evidence that the two firms may compete in

the same market.<sup>177</sup> This would be a necessary condition for two firms to compete in the same market, but it is not a sufficient condition.

- (56) Theoretical and empirical findings in economics suggest that incumbent firms also respond to even the *belief* that a rival firm or product may enter their market when they perceive that the threat of entry is a credible threat.<sup>178</sup> For example, economists have shown that when incumbent airline companies believe a lower-cost option may provide future service on a route they travel, these incumbents routinely lower their prices for trips on those routes in response.<sup>179</sup>
- (57) Steam is a two-sided platform, and these market definition tools must be applied to *both* sides of the platform to properly determine the relevant market.<sup>180</sup> Historically, Valve has charged

If the collection of firms could do so, then presumably the firms ‘outside of the market’ do not constrain the firms ‘inside the market’ much. For two-sided markets, this analysis must pay attention to both sides. It should consider firms that currently supply both sets of customers.”)

and collected Steam fees on purchases of games and other game content by taking a commission of sales from the publisher side of the market. In considering the principles underlying a proper market definition analysis, I assume that this pricing structure that Valve implements in the actual world would not change given a change in the level of Steam’s prices. That is, Steam would not add any new fee types and would only change its existing commission fee if it is imposing a price increase. It would not charge a fee to game purchaser users.

#### **4.1.2. Reference product and candidate market**

- (58) Based on my expertise as an economist, my experience, and the facts of the case, my candidate market is the market for third-party digital PC game distribution via platforms, where the two sides of the platform are (a) game publishers, on the one hand, and (b) game players, on the other. From the point of view of publishers, the product at issue is access to the platform. By buying access to the platform through an agreement to pay a commission to Steam for all transactions, developers are able to offer games to the user/gamer side of the platform. For users/gamers, the product they seek to acquire is games (and various in-game features). These platforms host both the publishers and gamers on the platform, connecting the two sides and facilitating transactions between them and gameplay. I recognize that some courts have described similarly structured platforms as “transaction” platforms or “transaction” markets, where the product at issue to both sides is a “transaction.”<sup>181</sup> Whether the product at issue is framed as a “transaction” or, alternatively, as access to the platform (publishers) and the purchase of a game (game players), the analysis is the same. Regardless, there are two sides to the market, married by a simultaneous purchase and sale of a good (a game).
- (59) A “third-party digital PC game distribution platform” is a platform that allows PC game publishers—specifically publishers other than the platform operator—to digitally distribute and sell games. A third-party digital PC game distribution platform on which users can also play the game allows for continuous interaction between player and publisher, including during gameplay. Examples of third-party digital PC game distribution platforms include Steam, EGS, and GOG Galaxy. See Table 1.

- (61) Popular publications also acknowledge that third-party digital PC game distribution platforms compete with Steam in this market. For example, a 2011 CNET article claims that EA is “tak[ing] aim at Steam” with the launch of Origin, and that Origin “is EA’s answer to Steam[.]”<sup>189</sup> In 2018, a Morgan Stanley analyst report stated that Epic’s launch of EGS would undercut “Steam’s headline take rate by more than half (12% vs. 30%). We see these signs of competition as bullish for content owners vs. game distribution platforms[.]”<sup>190</sup> In addition, a 2018 Verge article discussing the launch of the Discord platform states: “Discord. . . is now using its pervasiveness in the PC ecosystem to start competing with Valve’s Steam marketplace, which is far and away the largest PC game distribution platform.”<sup>191</sup> A 2021 Verge article discusses both Microsoft’s and Epic’s attempts to compete with Steam using a reduced commission rate to entice developers to the respective platforms.<sup>192</sup>
- (62) In my analysis, I also consider whether including third-party distribution of digital PC games through non-gameplay platforms should be a part of the relevant market. This includes distribution through online retail stores (*e.g.*, BestBuy.com, Target.com) and sales platforms (*e.g.*, Humble Store). Examples of digital platforms without gameplay include:
- Humble Bundle: Launched in 2010, Humble Bundle is a digital platform that sells PC games and digital content.<sup>193</sup> Humble is a publisher and sells other publishers’ games either individually or through Bundles, which often rely on game keys that participating publishers get from such a platform as Steam.<sup>194</sup>

#### 4.1.3. Considerations of potentially substitutable products in the relevant market

- (64) The candidate market is the market for third-party digital PC game distribution via platforms, where the two sides of the transaction are game publishers and game players who transact through the platform. Thus, potential substitutable options for publishers and gamers must also allow for the facilitation of these transactions between PC game publishers and PC gamers.
- (65) In making distribution choices, publishers will consider a variety of factors, in addition to the ability of gamers to be able to access and play the game. These include, for example, the size of the user base, the availability of other services from the platform operator, including game development tools, marketing support, and the like. For example, Valve provides a large global user base through the Steam platform, but also provides developer access to Steamworks tools and services. Valve highlights the importance of these characteristics. For example, a 2015 Valve presentation states that Steam is used by “[a]ll major game developers and publishers” and provides developers with “[a] suite of game development tools” and access to a “robust community” where developers can connect with customers.<sup>203</sup> Additionally, emails between Valve employees highlight Steam’s user base stating, “Valve operates Steam, which is the dominant PC gaming platform in the industry” with “65 million monthly unique visitors on average” and “14 million peak concurrent users on any given day[.]”<sup>204</sup> The Steamworks

- (66) Similarly, other third-party digital PC game distribution platforms advertise and offer such developer benefits. For example, Epic and GOG webpages advertise the tools and services that they provide developers for game development and distribution.<sup>206</sup> For example, an Epic webpage advertises that EGS allows developers to “[r]each a [g]lobal [a]udience” by providing “[d]irect distribution to over 230 million Epic users across 187 countries with 16 languages supported.”<sup>207</sup> Non-gameplay platform distributors also promote their user base to entice publishers.<sup>208</sup>
- (67) When considering their game distribution options, publishers may consider distributing games through, for example, third-party physical PC game distribution, such as through brick-and-mortar stores; first-party digital PC game distribution, in which the publishers distribute the games themselves; or non-PC game distribution, in which games are written to be played on devices such as consoles or smartphones. For a game publisher, value is realized

when gamers have the opportunity to find a game; thus, publishers want to maximize access to their games to PC gamers.

- (68) Publishers do not have to make a distribution choice that is exclusive; publishers will often consider (and may choose) to publish a game through multiple distribution channels. When a publisher chooses to publish a game across multiple distribution channels (or multiple outlets within one channel), it is a form of “multihoming.” Multihoming across distribution options can be consistent with these options being substitutes; if publishers could (or do) profitably switch to a new distribution method in response to an increase in the cost of selling games on through one channel of distribution, that suggests a possible substitutable relationship. However, multihoming is competitively meaningful only if it results in a publisher (or gamers) reducing their engagement with the first channel of distribution, affecting the profitability of that first channel and engendering a competitive response. That would imply a substitutable relationship between the options. However, rather than necessarily implying a substitutable relationship, multihoming can allow publishers to increase reach and capture different, *complementary* groups of gamers. As I discuss below, I conclude that these alternative distribution channels—such as brick-and-mortar PC game distribution, first-party digital PC game distribution, and non-PC game distribution—are overwhelmingly *complementary* to third-party digital PC game distribution via platforms and are not competitively meaningful substitutes.<sup>209</sup> Moreover, these complementary distribution avenues are not readily available to all developers.

#### **Other third-party PC game distribution**

- (69) Publishers can choose physical distribution rather than third-party digital PC game distribution via platforms. I conclude that physical distribution is not in the relevant market, because it is not an adequate substitute for digital third-party PC game distribution services. Because the user experience in a digital shopping environment is so different from a physical environment, users are unlikely to regard digital shopping and brick-and-mortar stores as substitutes for game purchases. In addition, a publisher distributing games through physical distribution avenues incurs (non-trivial) costs and frictions not found on digital third-party

---

<sup>209</sup> Any substitution is not the appropriate economic standard for consideration of the bounds of a relevant market. For example, while in theory someone might substitute milk for beer in some contexts, what matters is the cross-elasticity of demand between the two goods. If a hypothetical beer monopolist raised prices above competitive levels by a small percentage, it is exceedingly unlikely that party hosts, bars, and restaurants would begin serving milk. Instead, they would likely absorb the price increase and continue to serve beer. This example illustrates how there must be meaningful substitution to the alternative product in the presence of a small price increase in order for the alternative product to be potentially included in the relevant market.

distribution platforms. Given that, developers would not likely view these options to be reasonable substitute channels of distribution for their games. This conclusion is consistent with the move away from physical distribution and towards digital distribution. A small change in price is very unlikely to lead users to switch away from digital distribution and towards physical distribution, much less sufficient enough switching to render a price increase unprofitable.

- (70) For users, the game shopping experience on third-party digital PC game distribution platforms is much more flexible than with physical distributors. For example, digital third-party PC game distribution platforms are continuously available to users online, while traditional retail is restricted to certain operating hours. Unlike physical retail stores, users can instantaneously download and play purchased games on third-party digital PC game distribution platforms. Users can pause and resume shopping at any time without having to travel to stores, and users can search for and save games to a personal wish list to purchase later. Indeed, digital third-party distribution platforms advertise wish lists as a way for developers to boost their game’s visibility and connect with customers.<sup>210</sup> This feature is important to users, and thus to publishers looking to distribute their games.<sup>211</sup>
- (71) In addition, user search is different on digital platforms versus physical third-party distributors in ways that are economically meaningful to consumers. When searching for games on Steam, for example, users can filter games by price, tag,<sup>212</sup> number of players, and supported languages; users can sort those search results based on relevance, release date,

Players are always looking for good deals and a wishlist is the easiest to find out when games you want to buy drop in price.”)

(A publisher asks Valve: “We did a Daily Deal on March 27th, is there any room to do something else mid-May? Like a Weekend deal, something that will help us increase visibility and wishlist count for [REDACTED]”)

<sup>212</sup> Steam allows developers, players with non-limited accounts, and Steam moderators to “tag” games based on game genre, visual properties, themes, moods, and features that users can then filter by when shopping for games on Steam. See: Steamworks, Website, Steam Tags, <https://partner.steamgames.com/doc/store/tags> (accessed 11/1/2023).

price, and user reviews.<sup>213</sup> Some other third-party digital PC game distribution platforms provide similar filtering tools that allow customers to find games more quickly.<sup>214</sup> Digital distributors may also tailor their platforms to customers with personalized recommendations based on past purchases or data from other customers.<sup>215</sup> For example, Valve promotes various recommendation features including a customized home page, Discovery Queue, and Recommendation Feed.<sup>216</sup> Filtering and recommendation features provide a more seamless game search and purchase process compared to the consumer experience at brick-and-mortar stores. With distribution through brick-and-mortar stores, users must spend time researching games *prior* to visiting the store and physically purchasing games. Comparison shopping across games is more difficult in a physical environment, especially along the dimensions available on digital third-party PC game platforms. Thus, publishers receive a very different bundle of services with digital distribution as compared to physical distribution, including more ways in which users can learn about/find/purchase their games; accordingly, publishers are unlikely to view digital and brick-and-mortar third-party PC game distribution as a reasonable economic substitute.

- (72) Digital third-party PC game distribution platforms also provide users with a depth and breadth of offerings not possible in brick-and-mortar stores due to physical shelf space constraints that exist with physical distribution. Steam had approximately 18,000 unique products in its “main capsule” in 2018 and that main capsule “generate[d] millions of impressions every day[,]” compared to the “retail days [where g]ame success was gated by shelf space[.]”<sup>217</sup> Users can easily recognize that with physical distribution, store space constrains their choices. There are no such constraints on Steam.<sup>218</sup>
- (73) Similarly, developers also recognize the constraints of physical distribution. David Rosen, CEO of Wolfire Games,<sup>219</sup> testified that Wolfire did not attempt to sell any of its games through brick-and-mortar retail due to “very limited physical shelf space devoted to PC games even at its heyday in the nineties. By the early 2000s, they would have like one shelf for that and the rest for consoles. And these days I’m not sure they would even have that one shelf. They would just have Steam gift cards or something like that. . . . We weren’t worried about commission from brick and mortar. It’s more the impossibility of just manufacturing and storing physical copies. Like even if we got a deal with Walmart, that they would sell or stock 10,000 units of Overgrowth, we didn’t really have the knowledge of how to do that.”<sup>220</sup>

Digital [sic] distributors don’t have the same pressures that force physical distributors to lower prices. For starters, one thing that drives physical prices down, in fact one of the major things, is the cost of stock. . . . There is also the fact that with games, each month past release sees interest and demand for the game dropping markedly. Each month the stock goes unsold, lessens the chance that it will ever be sold. So what do retailers do in these scenarios [sic], they try to make the product more attractive by lowering the price. An unsold product generates no revenue and no profit. They’d rather a smaller profit margin than no profit margin at all. Now with digital, lo and behold there are no shelves, no warehouses or storage room. You have theoretically limitless display space so those two major pressures are pretty much non-existent [sic] in digital. Those are the two main forces that drive down physical game prices.”)

Did Wolfire ever attempt to have any of its games sold through brick-and-mortar retail? A. No. Q. Why not? A. It seems really unlikely for that to happen. There’s very limited physical shelf space devoted to PC games, even at its heyday in the nineties. By the early 2000s, they would have like one shelf for that and the rest for consoles. And these days I’m not sure they would even have that one shelf. They would just have Steam gift cards or something like that. Q. Did Wolfire consider whether the cost of distributing in brick or mortar store- --brick-and-mortar stores was too high in terms of commission or revenue share? THE WITNESS: We weren’t worried about commission from brick and mortar. It’s more the impossibility of just manufacturing and storing physical copies. Like even if we got a deal with Walmart that they would sell or stock 10,000 units of Overgrowth, we didn’t really have the knowledge of how to do that.”)

- (74) Digital distribution implies different business considerations compared to physical distributors; those differences are material to publishers. An internal Valve document discussing distribution with publisher [REDACTED] states that Steam’s business model, margins, and cost structure are “entirely different” than retail.<sup>221</sup> Similarly, as early as 2003, Valve recognized that “[Valve’s] margin on a retail box is about [REDACTED]. This compares to the Steam version at [REDACTED]. Steam derives profit [REDACTED].”<sup>222</sup> Publishers would need to consider these costs in their pricing, such that the physical distributor could still be profitable. Such costs do not need to be considered and/or absorbed by publishers in digital distribution.
- (75) In addition, Valve (and others) emphasize the relative convenience of digital distribution as a means of efficiently engaging users through a digital platform.<sup>223</sup> The trade press also acknowledges the benefit of digital distribution. For example, a 2020 article states: “For more than a decade, video games have been steadily shifting away from physical sales toward digital distribution, much the same as music and film. The transition creates opportunities for game publishers and consumers alike: cut down on production and shipping costs while offering the convenience of downloading products from the comfort of home.”<sup>224</sup>

For additional examples, see:

Gameopedia, “Digitisation: How It’s Changing the Landscape of Video Games, 10/18/2021, <https://www.gameopedia.com/digitisation-of-video-games/>. (The article lists “[c]onvenience and ease of access” as an advantage of digital distribution and states: “If you wanted a game ten to fifteen years ago, you would have to visit a physical store, find a copy of the game, and buy it. There were several possible problems, ranging from damaged discs to the game simply being out of stock, as well as the time taken to track down and buy the game. It is also less convenient to store and transport these discs– this is an added cost to the retailer. In today’s digital era, digital games can be bought online by customers with just a few clicks. These platforms also hold a huge variety of games, far more than most physical stores can stock.”)

- (76) Valve also does not see brick-and-mortar retail distribution as a reasonable economic substitute for developers. Scott Lynch, Valve’s COO, testified that, for publishers, there are many features and costs that differentiate traditional brick-and-mortar distribution from online distribution:<sup>225</sup>

Well, there’s -- there’s lots of [differences]. There -- for one, you know, packaged goods distribution is limited in terms of shelf space because, you know, they’re physical items that take up space. You have to put the game on a piece of plastic, CD-ROM, DVD, and then you’ve got to put it in a box and make it in a factory. And then you have to ship those boxes to all over the world. Eventually they have to get onto store shelves. Then you have to kind of make sure those store shelves are kind of organized and they’re doing a good job in terms of presentation. You have to worry about the inventory kind of being there in all the different stores when people go there and being out of inventory.

Returns are much more costly because packaged goods are costly. You have to go through this complicated sales process with the retailer and, you know, figure out how many you’ll sell in, what happens if they don’t sell through. You know, then -- you know, typically in the stores you have to do some retail marketing, point of presence kind of stuff.

You know, when a game ships out at retail in a piece of plastic, if there’s, you know, a problem with how the game was duplicated on the CD, that can be super costly trying to solve that problem. Doing updates, it’s typically quite a period of time.

And then in terms of, you know, lining all those things up at retail for the developer, you know, you’ve really kind of got to hit a ship date. So it’s pretty stressful on the teams trying to get to a ship date once you align all those things.

- (77) Thus, digital third-party PC game distribution platforms are differentiated from physical third-party distribution for both publishers and users. PC game sales through brick-and-mortar retail have nearly fully stopped, and this distribution/purchase channel is increasingly insignificant in the marketplace.<sup>226</sup> As such, I conclude that physical third-party distribution

is not sufficiently substitutable for publishers to include physical third-party distribution services in the relevant market.

### **First-party digital PC game distribution**

- (78) Another potential path for publishers is to self-distribute by developing their own first-party distribution platform.
- (79) Developing a distribution platform is costly. According to Dr. Rietveld, “building and maintaining a self-distribution platform to become fully integrated requires significant scale and financial wherewithal that most mid-sized publishers likely do not possess, and small publishers definitely do not possess.”<sup>227</sup> Unsurprisingly, publishers who have created first-party digital PC game distribution platforms are predominantly large and have the resources and popularity to support their own platform.
- (80) Even if a publisher can overcome the cost barrier, it is difficult for a *single* publisher to entice gamers to move to a standalone platform and likely impossible, as a practical matter, for multiple game publishers to accomplish that, especially in the presence of Valve’s conduct. Users want access to the platforms that have the most games and other users.<sup>228</sup> Those publishers who have attempted to launch first-party distribution platforms have generally been unsuccessful. For example, some platforms have struggled due to lack of users or limited content available for users to consume. For example, Bethesda “[gave] up on the idea of having its own launcher to compete with the likes of Steam and Epic Games. While those two can offer gamers hundreds if not thousands of titles to choose from, Bethesda’s own games

For example, when discussing UK physical retail gaming pricing, Valve remarked that “UK retail stores are no longer much of a problem,” and Valve employee, DJ Powers, elaborated on this statement in his deposition, stating that “[g]radually over time retail sales of boxed products for PC became less and less significant.” This demonstrates that physical PC game stores are not Steam’s competitors. cannot compete with such numbers, leading to the publisher announcing that it would shut down its launcher.”<sup>229</sup>

- (81) Several publishers operate platforms to distribute single games, such as Roblox (*Roblox*) and Mojang Studios (*Minecraft*). While these are first-party platforms (or self-publishing), these platforms differ from typical first-party platforms because both *Roblox* and *Minecraft* encourage the creation of in-game content by users to be consumed by other users. *Roblox* allows users that develop in-game content to offer it for sale to other users via its Marketplace.<sup>230</sup> *Minecraft* similarly allows users that develop in-game content to offer it for sale to other users via the *Minecraft* DLC Marketplace.<sup>231</sup> The interaction of users on these platforms thus differs from other first-party digital PC game distribution platforms. The emphasis that both *Roblox* and *Minecraft* place on user-generated content means the two games effectively operate as platforms, but with a multi-side component in its facilitation of transactions between game players. As such, it is most closely related to first-party distribution, but is even further removed in its substitutability because of its user experience.
- (82) First-party distribution platforms, as an alternative to distribution through the Steam platform, have been largely unsuccessful as a strategy. Publishers who started their own first-party distribution platform, such as Ubisoft and Activision Blizzard, have ultimately gone back to distributing their games on Steam *alongside* their own platform because of Steam’s market power. Valve has “a sticky platform with mature, engaged users.”<sup>232</sup> Ubisoft returned to Steam

in 2022 despite having described Steam’s business model and 30% commission as unrealistic and not reflective of “where the world is today in terms of game distribution[.]”<sup>233</sup> When it returned to Steam, Ubisoft remarked that “we’re constantly evaluating how to bring our games to different audiences wherever they are, while providing a consistent player ecosystem through Ubisoft Connect[.]”<sup>234</sup> In 2018, Activision Blizzard had removed its *Call of Duty* game from Steam and made it exclusive to its distribution platform Battle.net, but it reversed course in 2022 and released it back on Steam.<sup>235</sup> In a post-trial filing in the matter of *Federal Trade Commission v. Microsoft Corp. and Activision Blizzard, Inc.* related to Microsoft’s proposed acquisition of Activision Blizzard, Microsoft said:<sup>236</sup>

Activision’s attempt to take PC digital sales of Call of Duty exclusive to its Battle.net platform was a resounding failure. Before 2018, Activision sold digital versions of PC Call of Duty titles on Valve’s successful Steam platform. In 2018, Activision decided to take the game off of Steam and make it exclusively available on Battle.net—largely in an effort to attract users to, and grow, Activision’s own platform. Battle.net’s monthly active users (“MAUs”) remained relatively flat during the period when it had exclusive access to digital sales of Call of Duty on PC, from 2018 through 2022. . . . Meanwhile, during that same period and without access to Call of Duty, Steam’s monthly active users grew by tens of millions of users, nearly doubling from 67 million MAUs in 2017 to 132 million MAUs in 2021.

- (83) Microsoft noted that “Steam, the leading PC game store, has risen in popularity during the period where it was without *Call of Duty*.”<sup>237</sup> Microsoft’s recognition of Steam as the leading platform for PC games is consistent with its 2019 decision to release many of its PC games on

Steam, despite having its own distribution platform, Microsoft Store.<sup>238</sup> Similarly, Riot sells some of its games on Steam and EGS, while having its own distribution platform.<sup>239</sup> A reasonable economic inference is that first-party distribution is not a feasible standalone substitute for third-party digital PC game platforms. - (84) In addition, Valve’s internal documents show that publishers that leave Steam have historically done so because of short-term opportunities, such as advance payments and exclusives, and eventually return to Steam. For example, in 2019 *Metro Exodus*’ publisher was leaving Steam because of exclusivity.<sup>240</sup> When the publisher notified Valve that it was leaving Steam, it offered to return the game to Steam a year later, and Valve responded that “[w]e want to get Metro Exodus back on Steam, [REDACTED]”<sup>241</sup> In its 2019 business recap, Valve noted that “[f]irst EGS exclusives are returning to Steam[.]”<sup>242</sup> Steam Business Team member Tom Giardino testified that there are many developers that leave Steam to take advantage of Epic exclusives and then return to Steam after their exclusivity deals end.<sup>243</sup>
- (85) I have not seen evidence that Valve regards these first-party distribution platforms as meaningfully competitive threats. This suggests that Valve does not see them as substitutes.<sup>244</sup> In fact, internal Valve documents do not portray these first-party distribution platforms as vigorous competitive threats. Rather, if anything, they show non-competitive and collaborative relationships/partnerships with these platforms.<sup>245</sup> For example, after

And in your experience, why was that? A. As far as I can recall, I think there’s probably hundreds of games that have done that at this point. And I’m not sure what their different decision-making processes would look like.”)

For additional examples, see:

Valve, Competitive Landscape Analysis, undated (VALVE\_ANT\_1221442–444, at VALVE\_ANT\_1221443). (“[W]e’re also seeing some of the partners who wanted to run these experiments now coming back [to Steam] enthusiastically (most notably [REDACTED], and a handful of the early Epic Store exclusives).”)

Valve, Emails Regarding Publishing on Steam, 2/17/2021–2/18/2021 (VALVE\_ANT\_0624130–132, at VALVE\_ANT\_0624130–131). (“[I]t’s fine to release a game on Steam that has already come out somewhere else, and that’s actually a pretty big part of our business since some games do exclusive deals, or come back to Steam after launching elsewhere, etc. (So, stuff like all [REDACTED] titles coming back to Steam, or a game that was Epic-exclusive for 6 months, or whatever the case may be).”)

<sup>244</sup> Note that while first-party distribution platforms are not competitive threats to Steam, publishers that own such platforms and publish content on Steam are still subject to Valve’s PMFN Policy, as are other Steam publishers that publish their games anywhere else (e.g., retail). This is because Valve’s PMFN Policy is more broadly encompassing than just direct competitors in the relevant market and covers anywhere, wherein Steam publishers sell games. See Section 5.1 for detailed discussion of Valve’s PMFN.

<sup>245</sup> For additional examples, see:

Valve, Steam Presentation, c. 2014 (VALVE\_ANT\_1221398.pptx, at slides 3, 18). (The Valve presentation regarding “[REDACTED] on Steam” presents a graph of “[REDACTED] as a percentage of the Steam platform” in terms of revenue and

- (86) In sum, the vast majority of publishers choose not to engage in first-party distribution. Few attempts have been made, and very few, if any, of those publisher-launched first-party distribution platforms are successful, much less a competitive threat to Steam. The expense and user reach issues on the publisher side, as well as the user experience on the gamer side, suggest that this is not a feasible substitute; instead, at best and supported by the evidence, this distribution is complementary to third-party digital PC game distribution via platforms.<sup>249</sup>

<sup>249</sup> Similarly, a publisher could consider self-publishing via the web rather than building an entirely new platform. This self-publishing is less difficult than building a platform, and thus is more accessible to smaller publishers. However, for both publishers and users, this is not a sufficiently comparable method for distribution. For publishers, access to users is uncertain, at best, when publishing without a platform. See for example:

## PC game subscriptions

- (87) Publishers may also consider distributing their games through a PC game subscription model. A subscription model allows gamers to pay a flat monthly or yearly fee to play any game in a library of games.<sup>250</sup>
- (88) The services provided by PC game subscriptions and third-party distributors are distinct, and these distribution channels are likely not to be interchangeable for users and/or publishers. An internal Valve document emphasizes this point, stating that Game Pass, Microsoft’s subscription offering, is “fully differentiated from Steam and EGS, they’re doing something no one else is[.]”<sup>251</sup> As described below, the PC game subscription business model attracts a different user base and offers distribution for a limited set of developers compared to third-party PC game distributors.

Interview with David Rosen, 2/1/2024.

Users lose the ability to reach multiple publishers or interact with their friends like they would through a platform. Similarly, users have a hard time discovering these self-published games on publishers’ own websites, as demonstrated by such websites’ traffic, suggesting that most users keep their search limited to popular platforms they are on. See for example:

Game Gunk Website, Do Developers Need a Website to Host Their Own Games?, <https://game-gunk.com/do-you-need-a-website-to-host-your-own-game/> (accessed 2/4/2024). As such, self-publishing via the web is not an economically feasible substitute to distributing via platforms.

- (89) The purchase of a game subscription involves different financial and gameplay considerations than the purchase of individual PC games.<sup>252</sup> For example, purchasing a game subscription allows users to rent games for a period of time as opposed to owning them. the number of games between subscriptions and third-party digital PC game distributors, indicating that subscription models provide distribution for a limited number of developers. As of early 2024, there were approximately 90,000 games on Steam.<sup>260</sup> In contrast, Game Pass offers 428 games and EA Play offered on Origin has 95 games.<sup>261</sup> Therefore, while it is possible for subscriptions to offer distribution services that benefit developers, such as indie developers, the opportunities are still limited compared to third-party digital PC game distributors.

- (93) Valve documents also demonstrate that distribution through subscriptions is not widely accessible to developers. For example, several online sources describe that subscriptions provide a “curated” library.<sup>262</sup> According to Valve, having a curated strategy “means less clutter, ideally driven by quality, but it cuts out a number of titles and developers. That lowers the chance of seeing ‘surprise hits’ for customers and lowers the chances for [start-]up success

This statement refers to free-to-play games that are not developed by the publisher who is offering the subscription. Developers of these games cannot be properly compensated through a subscription model. However, a publisher offering a subscription may put its own free-to-play games in the subscription to diversify the subscription catalog and because the publisher will be compensated through subscription sales. **Console gaming**

- (97) I also consider whether distribution services for games to be played on consoles (*e.g.*, PlayStation, Xbox, etc.) are substitutes for PC-gaming distribution services. They are not.
- (98) Many large video game developers make PC games and console games.<sup>279</sup> I have seen no evidence to indicate that consoles are viewed as substitutes for digital PC game distribution via platforms. The evidence suggests that distribution services for PCs and consoles, if anything, are complements. Developers choosing between PC and console distribution services must consider the differences that exist in video game development requirements for the respective platforms. A video game developed for use on a PC (console) is not readily distributable on a console (PC), as the PC (console) game must first be adapted to the console’s (PC’s) parameters. There are time and monetary costs to creating multiple versions of a game that can be played on PCs and the set of different gaming consoles. Put differently, a developer seeking to distribute a game on PC and console (*e.g.*, PlayStation) must write unique versions of the game that will operate properly on each of those platforms. Porting a non-console game to be played on console is akin to “recreating and almost making a new game[.]” so such financial and technical constraints separate the PC games market from the console one.<sup>280</sup>

- (99) PCs used for games can be (and are) updated more frequently compared to the frequency of console releases. While the table above shows that major console hardware providers release consoles every four to eleven years, PC hardware “falls off the pinnacle of performance every 2 to 4 years” and gamers generally upgrade to a new system every two years.<sup>284</sup> Further, there is considerably less standardization across consumers’ PCs used for gaming. - (100) The wide variety of components available for gaming PCs allows for more flexibility in designing games. PC video game developers can take advantage of the latest performance capabilities,<sup>286</sup> allowing them to offer a broader range of video game titles across genres on PCs compared to consoles. Recent consumer research conducted by YouGov in more than 20 countries demonstrates that “in most of [the surveyed] countries, PC gamers outnumber console gamers.”<sup>287</sup>
- (101) There is a significant discrepancy in content availability between consoles and PCs. For example, as of March 2023, there were over 67,000 games available on Steam.<sup>288</sup> In contrast, there were around 12,000 games available on Nintendo Switch, 6,000 games on PlayStation 4 and 5 combined, and 3,000 on Xbox.<sup>289</sup>
- (102) Put simply, a PC video game developer may not be able to distribute via consoles. The major console providers—Sony, Microsoft, and Nintendo—serve as gatekeepers to their platforms in that their approval is required for a game to be available for play on their consoles.<sup>290</sup> Although

<sup>286</sup> A 2019 HP Tech Takes website post illustrates this point: “Today’s quick-moving games including first-person shooters (FPS), multiplayer games, open sandbox games, and more are built to reap advantages provided by the latest CPUs and their multi-cores and threads. In fact, they require them to play well. For instance, the first-person shooter multiplayer game *Call of Duty: Black Ops 4* recommends at least a quad-core processor: either the Intel i5-2500K, which has 4 cores and 4 threads, or AMD Ryzen R5 1600X, which has 6 cores and 12 threads. But for competitive players using high refresh-rate monitors (1080p), the game actually recommends an AMD Ryzen 1800X (an 8-core processor with 16 threads) or an Intel i7-8700K (which has 6 cores and 12 threads). The 8<sup>th</sup> Generation Intel i7-8700K happens to be one of fastest processors with some of the highest clock speeds (boost speed at 4.7 GHz) that Intel offers for gaming and streaming. Similarly, the acclaimed massively multiplayer online role-playing game (MMORPG) *World of Warcraft* recommends quad-core processors as well: Intel i7-4770 (4 cores, 8 threads) or AMD FX-8310 (8 cores, 8 threads) or better. The hugely popular online open-world game of *Grand Theft Auto V* recommends an Intel i5 3470 (4 cores, 4 threads) or AMD FX-8350 (8 cores, 8 threads). And the epic battle royale game of *Fortnite Battle Royale* recommends at least an Intel i5 2.8 GHz processor with 4 cores and 4 threads.” See:

console requirements have changed over time, this gatekeeping role can deter or prevent PC game developers from pursuing or accessing console distribution services. Even if a developer/publisher wants to develop a game for one/all of the consoles, that option may be foreclosed. To this point, the book *The Publishing Challenge for Independent Video Game Developers: A Practical Guide* states: “Alternatively, the indie games market on consoles is a lot less saturated than the PC market. Each console manufacturer has its own store and audience, with limited crossover. As developers, it is definitely more challenging to release on a console than to release on PC. With manufacturers being heavily involved in regulating content on these consoles, data availability is also limited.”<sup>291</sup> The author adds: “On the console market, first parties are still keeping their ecosystem quite closed with high barriers to entry. The access to development kits is more or less restricted and, in the case of Sony or Nintendo, pretty expensive.”<sup>292,293</sup>

Publishing a game with Sony for the PlayStation may require establishing a relationship with the office(s) corresponding to the geographic target(s) for the game. Further steps for the developer may include confirming any third-party plugins used are supported by the console (if not, rewriting code may be required), validating that the game meets Sony’s Technical Requirements Checklist (could include a list of necessary technologies that must be incorporated, optimizing for the PlayStation hardware, Functional

(103) Survey results demonstrate that a minority of video game consumers multihomed between PCs and consoles. A 2019 report from Deloitte that summarizes the results of its “Digital Media Trends Survey” conducted from 2015 to 2018 describes “multiplatform players” as those that “[t]oggle between platforms and use multiple devices” and estimates that such players represent “23 percent of the gaming population.”<sup>294</sup> “PC-dominant” players are estimated to represent “15 percent of the gaming population” and to spend approximately 1% of their time playing games on consoles; in comparison, “console-dominant” players are estimated to represent “23 percent of the gaming population” and spend less than 5% of their time playing games on PCs.<sup>295</sup> A 2022 survey conducted by the Entertainment Software Association (“ESA”) regarding video game playing habits reported that only 23% of the approximately 4,000 survey participants responded that they play video games on both PCs and consoles.<sup>296</sup> [REDACTED]

A 2023 Newzoo industry report shows that twelve of the top twenty “free-to-play” games released in 2022 were available on PC only,<sup>300</sup> consistent with a free-to-play or freemium model being more successful among PC video game consumers than console video game consumers. Accordingly, a developer’s intended genre and monetization strategy may mean targeting audiences that are more represented on PCs than consoles (or vice versa), leading to limited substitutability across platforms.

- (105) Additionally, documents and testimony confirm that video game distribution services for consoles are not directly substitutable with video game distribution services for PC.<sup>301</sup> For example, an internal Valve email chain containing summary notes of a meeting with [REDACTED] demonstrates Valve’s belief that launching video games on PCs and consoles simultaneously will not negatively impact console sales: “We have spent a ton of time and energy over the past two years trying to convince [REDACTED] that shipping day and date on the PC won’t cannibalize their console sales.”<sup>302</sup> In 2017, a publisher told Valve it was unable to run a promotion of its game’s PC version on Steam because of an exclusive

### Mobile gaming

- (106) I also consider the possibility that distribution services for games played on mobile devices (e.g., iPhone, Samsung, etc.) are substitutes for PC-gaming distribution services. Based on the record evidence and my research and analysis, I conclude that game distribution through mobile app stores is not a substitute for digital PC game distribution platforms. In fact, PC and mobile games (and their associated distribution services) are complements.
- (107) PCs and mobile devices are used for different purposes by consumers, offer different gaming experiences, and serve different gaming audiences. Mobile devices are used “to perform various tasks on the go,” such as making phone calls, sending texts, “browsing the internet, checking emails, [and] playing games[.]”<sup>307</sup> Games are used relatively minimally as compared to accessing the internet, communication by text, and the like. By contrast, PCs are used for more intensive tasks such as playing video games, “writing documents, editing videos, [and] creating applications[.]”<sup>308</sup> PC gaming provides users with more control and customization

A source from the European Commission regarding the Activision Blizzard/King merger confirms the GDC survey results described above. purchase and play PC games on their laptops and desktops.”<sup>322</sup> Valve considers “the mobile [game] market as a little bit different from PC,” and even suggests that publishers who choose to sell games on both platforms “may wish to use a different business model or content strategy between the two places.”<sup>323</sup>

(110) Valve indicates that while mobile games can be brought to PC, there are a variety of considerations for developers attempting to do so. For example, Valve lists game resolution, input, and the business model as important factors publishers wanting to bring mobile games to PC should consider, noting that “resolution is important for how your game appears on physically larger and higher-resolution [PC] screens” and inputs such as “[k]eyboard, mouse, [and] controller” are all important to get right.<sup>324</sup> Valve encourages publishers to bring their non-PC games on Steam regardless of the “operating systems [they] are currently building for[,]”<sup>325</sup> suggesting that Valve sees the PC gaming community as a separate, untapped, and arguably complementary market for mobile game developers.

(111) Given the evidence, distribution of games via mobile app stores is complementary. It does not represent a substitute to third-party digital PC game distribution via platforms, and thus is not included in the relevant market.

### Cloud gaming platforms

(112) I also consider the possibility that cloud gaming platforms are substitutes for PC-gaming distribution services.<sup>326</sup> I find that game distribution through cloud gaming services is not a viable substitute for PC game distribution services.

<sup>326</sup> Note that while I consider other forms of cloud gaming, such as cloud gaming as an additional feature on a given platform or cloud gaming as a complementary product, whereby a subset of games purchased elsewhere can be connected to an account, these cloud gaming options do not and cannot present reasonable alternatives or substitutes to PC-gaming distribution services.

For example, Microsoft’s Game Pass offers a cloud gaming feature with an upgraded subscription. See:

## 4.2. Economic assessment of monopoly power

### 4.2.1. Measurement of monopoly power in the relevant market

- (121) Antitrust analysis is focused on situations where firms engage in anticompetitive conduct, such as attempting to monopolize a market or maintain a monopoly in a market through the suppression of competition.<sup>346</sup> If a firm can influence market prices, that firm possesses *market power*.<sup>347</sup> In the language of economics, if a firm faces a downward sloping demand curve—consumers will purchase more at lower prices and less at higher prices—that firm has market power.<sup>348</sup> Market power is a non-pejorative term. The overwhelming number of firms operating in the economy possess some degree of market power. Most firms have some control

over the prices they charge—and, thus, some degree of market power—because of product differentiation.<sup>349</sup>

- (122) Market power exists on a continuum. At one extreme, firms have no market power, as in a *perfectly competitive* market.<sup>350</sup> At the other extreme, as in a *pure monopoly*, there is only one firm—the *monopolist*—with complete control over the market price.<sup>351</sup> In between these extremes are markets characterized as *imperfectly competitive*.<sup>352</sup>
- (123) Market power becomes a concern for antitrust analysis when a firm gains significant market power, sometimes referred to as *monopoly power*.<sup>353</sup> Firms with monopoly power can set and sustain prices above the competitive level and set market output below the competitive level, *i.e.*, “artificially restricted below the socially optimum level.”<sup>354</sup> They can exclude competitors or make it difficult for competitors, whether existing or new entrants, from having the opportunity to compete effectively on the merits. A market’s structure—which refers to characteristics such as the size and strength of competitors and potential competition—is one of the indicia of market and monopoly power.<sup>355</sup> One way to describe market structure is by measuring market concentration. An oft-used measure of market concentration is the Herfindahl-Hirschman Index (“HHI”).<sup>356</sup> The HHI is calculated as the sum of squares of the market shares of the firms in the relevant market.<sup>357</sup> A perfectly competitive market would

have an HHI close to zero, a pure monopoly would generate an HHI of 10,000 (= 100 × 100).<sup>358</sup> While high concentration does not, by itself, *prove* that a firm has monopoly power, a persistent high level of concentration is indirect evidence of monopoly power.

- (124) Another metric for assessing market power is the Lerner Index, which measures a firm’s price to marginal cost.<sup>359</sup> The Lerner Index is calculated by taking the difference between the price at which the firm sells its output and its marginal cost for that output (“price-cost margin”), and then dividing by the price:<sup>360</sup>

$$\text{Lerner Index} = \frac{P - MC}{P}$$

- (125) A perfectly competitive firm would have a Lerner Index equal to 0, as price is equal to marginal cost.<sup>361</sup> As a firm acquires more market power, its price-cost margin increases, and the Lerner Index rises. All else equal, a larger Lerner Index value is consistent with a greater degree of market power, with a perfect monopoly equal to 1.<sup>362</sup>
- (126) Economists look to see if there is either direct or indirect evidence of monopoly power.<sup>363</sup> Monopoly power can be inferred from direct evidence that a firm can raise prices to a supracompetitive level for an extended period of time,<sup>364</sup> along with “evidence of restricted

output” and “an abnormally high price-cost margin.”<sup>365</sup> Monopoly power can also be inferred from direct evidence of “actual exclusion of competition from the relevant market.”<sup>366</sup>

- (127) In some instances, direct evidence of monopoly power may be difficult to attain. In such cases, economists also examine indirect evidence of monopoly power, *e.g.*, market share or entry barriers. While not dispositive, a persistently high market share provides economically meaningful indirect evidence of monopoly power.<sup>367</sup> While there is no specific market share threshold establishing monopoly power, there are share levels that are often viewed as meaningful demarcation points. For example, “a market share in excess of 70 percent generally establishes a *prima facie* case of monopoly power.”<sup>368</sup> Relying on market share as evidence of monopoly power requires evidence of “a relevant product market,” “a dominant share of the relevant market,” and “high barriers to entry.”<sup>369</sup> In addition, for such shares to support meaningful inferences about the presence of monopoly power, such high shares must be persistent.

#### **4.2.2. Valve’s supracompetitive commission rate is direct evidence of monopoly power**

- (128) A firm raising prices to a supracompetitive level for an extended period of time is direct evidence of monopoly power.<sup>370</sup> As will be discussed in more detail in Section 6.1, Valve has

set and maintained a supracompetitive commission rate on Steam. Even in the face of entry, as discussed in Section 6.2, Valve maintains its supracompetitive commission rate. While Valve moved to a tiered commission structure in 2018,<sup>371</sup> that revised commission structure still establishes supracompetitive rates. Most developers still face the 30% commission rate, and those who make enough sales to reach the lower-rate tiers are *still* overcharged. See Sections 7.4 and 8.5.

- (129) As a matter of economics, Valve’s supracompetitive commission rate also results in decreased output, all else equal.<sup>372</sup> Since the fees are higher than what would exist in a competitive market, publishers have higher marginal costs. Publishers must consider those costs when determining consumer prices for their games, potentially passing through those costs, at least in part, to the consumer. This leads to higher consumer prices, which decreases the quantities of games purchased by end consumers of games. For example, Microsoft changed the developer’s share of Microsoft Store PC games sales net revenue from 70% to 88% in order to “empower every PC game creator to achieve more.”<sup>373</sup> Microsoft added that “[a] clear, no-strings-attached revenue share means developers can bring more games to more players and find greater commercial success from doing so.”<sup>374</sup>

#### **4.2.3. Valve’s high and sustained market share over time is economic evidence of monopoly power**

- (130) Valve’s worldwide market share, measured in terms of third-party game user sales occurring on Steam, is between approximately [REDACTED].<sup>375</sup> As discussed in Section 4.2.1, this provides a powerful economic basis for the conclusion that Valve has monopoly power in the relevant market. The fact that Valve has been able to sustain this high market share is further evidence of its monopoly power.

- (131) Evidence from this case and trade press support the conclusion that Valve’s market share in the relevant market is high and has been over time. For example:<sup>376</sup>
- a. An indie game handbook (2015) states that “[t]he portal of choice is most definitely Steam. In every indie sales report I’ve seen, Steam sales eclipse all other portals by a large margin, often selling several times more than on other portal sites.”<sup>377</sup>

In email correspondence offering a publisher advice regarding Steam (2018), Valve told the publisher that “[i]f, like many other publishers, you see [REDACTED] of your PC business via Steam, I’d prioritize making sure you’re priced as competitively as possible on Steam rather than tweaking steam [sic] prices to accommodate a store with much lower throughput[;]” the publisher then confirmed that “[y]ou are correct that the vast majority of our business comes from Steam.”<sup>378</sup>
  - c. An EGS board presentation (2019) calculates market shares for a handful of potential competitors in 2018 and expectations for 2019, with Steam taking the vast majority of the market, 94.0% and 86.2%, respectively.<sup>379</sup>
  - d. As noted previously, Discord’s sales are likely *de minimis*. As discussed throughout this report, the Discord Store was first established in 2018, but was unable to successfully compete and exited the relevant market in 2019. See Section 6.2.

I have similarly found no evidence of third-party sales on Itch.io, however, I understand that Itch.io’s sales are *de minimis* and would not impact Steam’s share of the relevant market. See Section 6.2.

As discussed throughout this report, EA was unable to succeed with their third-party offerings on their own platform. See Section 6.2. On June 13, 2022, EA stopped offering games from third-party publishers on the Origin platform. See:

Electronic Arts, “Upcoming Changes to the EA Origin Catalog,” c. 6/2022, <https://www.ea.com/ea-pc-third-party-titles-2022>.

Further, I understand the majority of EA’s PC gaming revenues are associated with first-party games and subscription services. For example, Epic’s presentation that calculates 2018 and 2019 market shares does not explicitly state any sales for EA’s third-party platform. See:

Epic, “Presentation to the Board of Directors,” 8/13/2019 (EPIC\_VALVE\_0000364–389, at EPIC\_VALVE\_0000369).

Additionally, EA’s Form 10-Ks do not mention third-party sales, instead emphasizing first-party offerings on their own platform and on other third-party platforms, such as Steam. For example, EA’s Form 10-K for the fiscal year ending on March 21, 2022, which was before EA stopped selling third-party games on its platform, states that “[EA’s] PC games and services can be downloaded directly through Origin, EA’s digital storefront, as well as through third-party online download stores, such as Steam.” The filing further states that, “We also offer our EA Play subscription service on consoles and PC as we look to build deeper relationships with our players and offer increased choice and flexibility for our players to try new games.” EA also states that they “derive revenue principally from sales of *our* games, and related extra content and services that can be experienced on game consoles, PCs, mobile phones and tablets.” EA lists the following as their main “product and service offerings”:

“[F]ull games with both online and offline functionality (‘Games with Services’), which generally includes (1) the initial game delivered digitally or via physical disc at the time of sale and typically provide access to offline core game content (‘software license’); (2) updates on a when-and-if-available basis, such as software patches or updates, and/or additional free content to be delivered in the future (‘future update rights’); and (3) a hosted connection for online playability (‘online hosting’); full games with online-only functionality which require an Internet connection to access all gameplay and functionality (‘Online-Hosted Service Games’); extra content related to Games with Services and Online-Hosted Service Games which provides access to additional in-game content; subscriptions, such as EA Play and EA Play Pro, that generally offer access to a selection of full games, in-game content, online services and other benefits typically for a recurring monthly or annual fee; and licensing to third parties to distribute and host our games and content.”

(134) Mr. Lynch testified that the reason Steam is more valuable to both developers and users is because there are a lot of “developers putting games on Steam” and a lot of users who play those games on Steam.<sup>386</sup> This is a classic description of strong network effects<sup>387</sup> and network effects, all else equal, make entry more difficult. The issue here is that Valve’s policies prevent any entrant from building its own network effects and challenging the dominance enjoyed by Steam. As Valve prevents entrants from building their network effects, its policies to strengthen its own network effects creates entry barriers and insulates Valve from a meaningful threat of effective entry.<sup>388</sup> Valve states that “sophisticated players like [REDACTED] haven’t really entered the picture yet[.]” so it is “important for us to expand the reach of the platform into new territories[.]”<sup>389</sup> This plan raises the height of entry barriers and provides Valve with a mechanism to protect its monopoly power in the relevant market.

#### **4.2.4. Valve’s high and sustained profitability over time is economic evidence of monopoly power**

(135) A key indicator of monopoly power is sustained profitability. Persistently high margins are consistent with the possession of monopoly power; when those high margins persist in the face of competition or when potential rivals are prevented either from entering or from being effective competitors (*e.g.*, due to Valve’s PMFN Policy), such persistently high profits likely indicate monopoly power, all else equal. Valve’s [REDACTED] in the relevant market have [REDACTED]; perhaps more importantly, its [REDACTED] have remained [REDACTED], as well, even in the face of market entry.

(136) In a market where there is effective competition, Valve’s supracompetitive profitability on Steam would attract potential entrants, leading to competition on price and a reduction in profitability for Steam. That has not happened in this market. There are significant barriers to entry that deter potential competitors, and even when competitors have entered the market,

policies such as Valve’s PMFN prevent them from being effective competitors, competing away some of Steam’s profits, and eroding its margins.

#### **Valve’s Steam financial reports**

Scott Lynch, Dep. Tr., 10/13/2023, at 95:9–96:4.

Q. What is Cyber Cafe? A. Cyber Cafe is a -- generally it's retail establishment that, you know, has PCs that people can rent and there might be, you know, a license that they can purchase from Steam to, you know, operate those games commercially, a commercial license.

Valve's P&Ls show that Cyber Café's revenues changed from in 2004 to in 2008 but then to in 2013. See:

Valve, “Valve Corporation Profit & Loss: January 2004 Through December 2009,” 1/4/2010 (VALVE\_ANT\_0311248.xlsx, at ‘QB’ tab). (See ‘Cyber Café’ line item )

(140) This approach to reporting revenues and costs is economically misleading and artificially deflates Steam’s reported margins as a result. Recall that Steam is a platform on which third-party developers make their games available for purchase to end consumers. Valve emphasizes that Steam “work[s] on rev[enue] share[,] not on wholesale price”<sup>394</sup> and, accordingly, collects a prespecified portion (*e.g.*, 30%) of the transaction values of games purchased on its platform, while the remainder of the transaction values (*e.g.*, 70%) is remitted to developers and contributors for game modifications.<sup>395</sup> For these transactions, Steam neither sets the price nor holds intellectual property or other rights to the game; Steam merely operates as a distribution agent.

(141) Valve’s Steam revenues should reflect the economic value it receives for the services *Steam* provides. [REDACTED]

(142) Thus, Valve’s reported Steam financials produced in connection with this case are not a fair representation of the underlying economics of the transactions on the Steam platform. They do not appropriately reflect the payment and costs Valve received and incurred for the services provided. Thus, as an economic matter, they misrepresent actual revenues received and costs incurred. Because of the distortion created by this misrepresentation, the financial statements produced in connection with this case are not reliable economic indicators of either the revenues, costs, or profits for the Steam platform. - (149) In the digital game distribution market, costs are significantly lower than the commission rates that Valve has set. Valve could still maintain Steam’s profitability—even high profitability—with lower commissions. Put differently, the high commission rates are not required for Steam to be profitable. Epic, for example, determined that its EGS platform (even when not including Fortnite revenues), would be profitable if it used a commission rate of as low as 10% or 12%, even including “influencer payouts” of 5% and payment processing costs of 2.55% coming out of EGS’s share.<sup>406</sup> Further, Epic CEO Tim Sweeney stated that Epic

## 5. Valve’s Maintenance of Monopoly Power

### 5.1. Valve’s PMFN Policy

(150) Valve has adopted policies that insulate it from competition by ensuring that offers of games on Steam are in parity with offers on other competing platforms. In other words, Valve has policies that require that the offers on Steam are at least as attractive as elsewhere. Valve employees have described parity as a “platform goal,”<sup>412</sup> a “policy,”<sup>413</sup> and a “practice.”<sup>414</sup> Valve ensures parity both in terms of the content included in games and prices. Valve requires all publishers that publish games on Steam to enter into an SDA,<sup>415</sup> which expressly obligates publishers to provide the same content (games, DLC, etc.) as they provide on competing platforms.<sup>416</sup> As such, Valve contractually requires content parity. Valve’s price parity policy, as discussed below, requires that publishers sell their PC content (games, DLC, etc.) on Steam at the same prices as those offered on competing platforms. In practice, the parity requirements mean that no publisher can differentiate its offerings across competing platforms, and no rival platform can compete by inducing publishers to offer a different deal to consumers purchasing/playing games on that rival. Together, Valve’s parity policies

constitute a platform most-favored nation policy, or PMFN Policy. For further discussion on enforcement of Valve’s PMFN Policy, see Section 5.2.

### 5.1.1. What is a PMFN?

- (151) Most Favored Nation (“MFN”) contractual provisions, historically invoked in connection with trade between countries, are also often found in contracts between buyers and suppliers.<sup>417</sup> They are sometimes called “Most Favored Customer” provisions.<sup>418</sup> While the exact details of these provisions can differ, the common element is a requirement that one party to the transaction (*e.g.*, the seller) not offer better terms (*e.g.*, a lower price) to any other party (*e.g.*, another buyer).<sup>419</sup>
- (152) At issue here is a type of MFN arrangement between a platform and a platform participant.<sup>420</sup> Platform MFN, or PMFN, clauses (sometimes also known as “price parity provisions”)<sup>421</sup> generally require that the seller side of the platform (in this case, the game publishers) not offer the buyer side of the platform (here, game purchasers) a lower price on any other distribution channel.<sup>422</sup> Where a traditional MFN restricts the price at which a supplier can

- (153) Economists have found that PMFN provisions can lead to increased platform fees and consumer prices.<sup>425</sup> That finding is robust under a variety of demand conditions: PMFNs tend to result in increased prices charged by sellers and increased fees charged by the platform.<sup>426</sup> Studies have also found that PMFNs decrease incentives for competing platforms to enter, thereby leading to more concentrated markets.<sup>427</sup> Boik and Corts demonstrate that PMFNs

Indeed, a review of the main decisions by competition agencies reveals a consensus as to the possible harmful effects which wide MFNs combined with an agency model may generate. The most publicised case which involved wide MFNs, and was pursued on both sides of the Atlantic, concerned Apple’s use of wide parity in its iBooks Store.” Price

discourage entry of platforms that are downwardly differentiated (*i.e.*, employing a low-cost strategy).<sup>428</sup> This is an intuitive result; a platform intending to compete on cost with an incumbent platform that utilizes PMFNs will face a challenge to attract customers through its primary advantage: lower prices. See further discussion in Section 7.2.1.

### 5.1.2. Valve’s PMFN Policy

- (154) Valve’s PMFN Policy includes two elements: content parity and price parity. The content parity element requires that publishers provide the same or better game content on Steam than elsewhere. Similarly, the price parity element requires that publishers offer the same or better price on Steam than elsewhere. Valve communicates the PMFN Policy to the market through its contracts and documentation with game publishers, its communications directly with publishers, and its enforcement efforts communicated through statements and other acts. I discuss these points in further detail below.
- (155) Section 2.4 of Valve’s SDA requires that if a publisher distributes a game “through any other (non-Steam) distribution channel, and if [publisher] distributes any material DLC for the Application [(game)] through that other channel, it will deliver the DLC to Valve at the same time such that Steam Account Owners will receive comparable DLC with customers acquiring the Application [(game)] through other channels.”<sup>429</sup> Section 2.1 of the SDA also requires that localized versions and game updates be delivered to Valve “when available, but in no event later than they are provided to any other third party.”<sup>430</sup> Section 2.4 of the SDA stipulates that the publisher “is free to offer special and unique promotional content” on other platforms

parity clauses “may lead to a restriction of competition through excessive intermediation and price uniformity and they may also limit low cost entry.”)

as long as “material parity is maintained between Steam Account Owners and users of other distribution channels who make a comparable investment in the Application [(PC games)] and the associated DLC.”<sup>431</sup>

- (156) Members of the Steam Business Team, the team within Valve that enforces the PMFN, confirm that Sections 2.1 and 2.4 of the SDA are about content parity.<sup>432</sup> For example, Steam’s Business Team has instructed developers: “We ask that digital content you offer outside of Steam be made available to Steam users directly so that the Steam version is not disadvantaged.”<sup>433</sup> One Steam employee responsible for providing this instruction to developers (Augusta Butlin) testified that the instruction is consistent with her communications with developers about “the spirit of the SDA.”<sup>434</sup> Steam’s Business Team has also conveyed that delays in updating content on Steam constitute a content parity violation: “It’s not OK to launch a DLC on your own or other stores, and then bring it to Steam some weeks or months later.”<sup>435</sup> These content parity provisions are generally uniform across Valve’s SDAs.<sup>436</sup>
- (157) Valve also enforces price parity as part of its PMFN Policy. This policy is clearly articulated to publishers requesting Steam Keys. When a publisher requests Steam Keys, it must agree to three commitments.<sup>437</sup> Specifically:

---

<sup>431</sup> Valve, “Steam Distribution Agreement – Online Version,” 10/15/2018 (VALVE\_ANT\_0029429–47, at VALVE\_ANT\_0029430, VALVE\_ANT\_0029432). (See Section 2.4 of the Agreement.)

- a. “I understand that I need to sell my game on other stores in a similar way to how I am selling my game on Steam. I agree that I am not giving Steam customers a worse deal.”<sup>438</sup>
- b. “I understand that while it’s OK to run a discount on different stores at different times, I agree to give the same offer to Steam customers within a reasonable amount of time.”<sup>439</sup>
- c. “I understand that if I request an extreme number of keys and I’m not offering Steam customers a fair deal, or if my sole business is selling Steam keys and not offering value to Steam customers, my request may be denied and I may lose the privilege to request keys.”<sup>440</sup>

(158) The vast majority of publishers offering games on Steam—[REDACTED]—have utilized Steam Keys.<sup>441</sup> Thus, the overwhelming majority of publishers on Steam have been exposed to the price parity obligation. Although these commitments are made as part of the process for requesting Steam Keys and the third commitment is limited to Steam Keys, the language of the first two commitments is *not* limited to Steam Keys. Valve has conveyed to publishers that it expects them to abide by the commitments in this form regardless of whether Steam Keys are at issue.<sup>442</sup>

(After making this statement of the price parity requirement, clearly not limited to Steam Keys, Tom Giardino sent a screenshot of the three commitments in the Steam Key request form: “[W]e wouldn’t be OK with selling games on Steam if they are available at better prices on other stores, even if they didn’t use Steam keys. If you wanted to sell a non-Steam version of your game for \$10 at retail and \$20 on Steam, we’d ask to get that same lower price or just stop selling the game on Steam if we couldn’t treat our customers fairly.”)

- (159) Valve also reiterates the price parity portion of its PMFN Policy is in its Steamworks Documentation’s “Steam Key Rules and Guidelines,” which require publishers to use Steam Keys to sell their games “on other stores in a similar way to how you sell your game on Steam. It is important that you don’t give Steam customers a worse deal than Steam Key purchasers [on other stores].”<sup>443</sup> For example, publishers would not be allowed to give away free games on other stores, unless they offer the same deal to Steam customers; similarly, publishers can discount Steam Keys “on different stores at different times as long as [they] plan to give a comparable offer to Steam customers within a reasonable amount of time.”<sup>444</sup>
- (160) Valve communicates to publishers that the price parity requirement applies equally to Steam Key and non-Steam Key transactions and enforces that requirement as such. For example, a member of the Steam Business Team summarized the policy in a May 2017 email to a publisher as follows: “Do-able: Sell the same content and make sure the price on Steam is competitive with where it’s being sold anywhere else (using keys or not, in a bundle or not). Not doable: Sell the content to another store at a better price than Steam customers get (using keys or not, in a bundle or not).”<sup>445</sup> See Section 5.2.2 for further discussion of Valve’s communications that the price parity requirement is not limited to Steam Keys.
- (161) Publishers are also aware that Valve’s parity requirements for Steam Keys apply more generally to pricing. Valve has repeatedly explained to publishers that it could choose to stop selling non-compliant games. For example, in a March 2013 email to a publisher named [REDACTED], Valve explained that its parity requirement applies regardless of whether Steam Keys are at issue: “If your long term strategy is to sell the game super cheap, that’s fine. But constantly offering your products at way better prices on other stores isn’t OK, whether you

use Steam keys or not.”<sup>446</sup> Valve threatened to delist games on Steam at higher prices than on other stores: “We just opt to stop selling games if partners don’t treat our customers fairly.”<sup>447</sup>

(162) Valve also communicated the price parity portion requirement applies to foreign transactions in foreign currencies. The “FAQ” portion of the announcement discussed Valve’s “suggested pricing matrix,” which recommends relative prices across currencies.<sup>448</sup> That is, based on the price that a publisher intends to set for a game in the United States, this tool recommends how the game should be priced in other countries. One of the questions in the FAQ section of this announcement asks the following: “Am I required to use Steam’s suggested pricing?” The answer contains the phrase: “Just make sure that you’re not disadvantaging Steam customers.”<sup>449</sup> In other words, the publisher must not offer the game at a lower price or provide more/different content on a different platform than on Steam, even across geographies and currencies.

(163) A draft version of this announcement was circulated internally among Valve employees in July 2015.<sup>450</sup> In addition to having the same language as the final announcement, the draft version of the announcement included a specific example: “Just make sure that you’re not disadvantaging Steam customers; [REDACTED]

available at better prices on other stores, even if they didn't use Steam keys. If you wanted to sell a non-Steam version of your game for \$10 at retail and \$20 on Steam, we'd ask to get that same lower price or just stop selling the game on Steam if we couldn't treat our customers fairly.”<sup>453</sup> Valve confirmed this was not a new policy: “No, we've always asked that partners treat our customers fairly, and we've often opted not to promote games or stop selling them altogether if we aren't able to get fair treatment for our users.”<sup>454</sup> The practical effect of the PMFN is to make sure that Steam customers have little incentive to go elsewhere to purchase and play games.

(165) In April 2019, a publisher named [REDACTED] asked Valve whether its parity requirement extends beyond Steam Keys (while mistakenly assuming this requirement was documented in the SDA): “I can't find the contracts. Where [is it] about selling the game on other platforms and not going cheaper than on [S]team: is this only about keys or also about selling the game independently [sic], not using Steam keys at all?”<sup>455</sup> In response, Valve confirmed it took fundamentally the same stance regardless of whether Steam Keys are at issue: “[W]e try not to focus too much on whether the game is being sold via Steam key or not. It is a specific thing we ask people to respect when they sell keys, but we're also uninterested in operating a store that gives people bad offers- so we just stop selling games if we aren't able to secure the equivalent price for them.”<sup>456</sup> Valve then gave a specific example: “(For instance if another service like Uplay or Origin was selling a game for \$15 and we were selling it for \$20, we'd ask the dev to give us that lower price or opt to not sell the game, even if the sales at the other store weren't using Steam keys.)”<sup>457</sup>

(166) Steam publishers, including the largest publishers in the PC game industry, are aware of Valve's parity requirements.<sup>458</sup> For example, in an internal email among Microsoft employees,

[T]he Steam publishing agreement historically has required product and price parity. When I looked at it pre Age:DE a few years ago, I found that we could sell at any price we wanted before Steam release, but once we released on Steam we needed to give Steam price parity to our other digital channels. In the case of a GoW5 Steam/Windows Store (Garrison) simship, I’d assume Steam demands you don’t undercut them once you release on Steam.

### 5.1.3. Valve’s PMFN Policy is a barrier to entry

- (168) Valve imposes barriers to entry through its PMFN Policy and enforcement practices. Absent these Valve-imposed barriers, other platforms could compete for publishers to join their platforms exclusively or increase the frequency with which they multihome. Given the prevalence of comparatively lower commission rates on alternative game distribution platforms, publishers would further be incentivized to steer customers towards the distribution platform with the lowest commission rate, using lower prices or differentiated content to do so.

Other documents indicate that Valve may try to limit the appearance of its parity requirements in formal documentation because of concerns about antitrust risk. See, for example:

Valve, Emails Regarding New Currencies on Steam, 7/9/2015–7/24/2015 (VALVE\_ANT\_0114214–20, at VALVE\_ANT\_0114214), available at Tom Giardino, Dep. Tr., 11/2/2023, Exhibit 187. (In a series of emails regarding a draft of an announcement about pricing in foreign currency, Mr. Giardino wrote: [REDACTED])

- (169) Valve requires publishers on Steam to abide by its PMFN Policy, which constrains publishers from pricing a game differently or providing different content across platforms. Valve restrains publishers’ ability to set game prices and release content for games on other platforms. The PMFN Policy reduces publishers’ ability to increase both sales and revenues by providing different prices and/or content across platforms as a way of attracting customers to those platforms. This limits the ability of competing platforms to grow and be effective competitors to Steam.
- (170) Consider, for example, a publisher who offers a game on both Steam and an alternative distribution platform and would like to offer lower pricing on another platform. Assume the publisher’s effective commission rate is 30% for sales on Steam and 12% for sales on the alternative distribution platform. This difference in commission rates may create an incentive for the publisher to charge a lower price on the alternative platform to drive interest and sales, as it can maintain revenue levels given it retains a larger share of revenues on each sale on that platform. So, if the price for the game on Steam is \$10, the publisher could earn equal revenues on the alternative distribution platform by pricing the game at \$7.95.<sup>463</sup> Applying basic economic principles to this hypothetical situation results in the conclusion that the publisher could both (a) sell more copies of its game on the alternative distribution platform by offering a lower price and (b) earn more or equivalent revenues for any sale on the alternative distribution platform when compared to an identical sale on Steam.
- (171) Valve’s PMFN Policy prevents publishers from engaging in this pricing behavior, hampering rival platforms’ ability to compete with Steam. Competition on price is one important avenue for potential platforms to compete on the merits, gain interest from consumers and developers, and grow user base volume on both sides of their platforms. In the absence of meaningful price competition, a rival platform must employ other methods to differentiate itself from Steam. One such example could be to provide different content on platforms other than Steam to entice customers. However, the PMFN Policy restricts that competition, as well. Steam is the dominant platform in the relevant market in terms of publishers and users. Without a significant portion of PC gamers transacting with alternative distribution platforms, multihoming by developers cannot produce meaningful constraints for Valve. A publisher who lists a game on Steam and alternative distribution platforms is likely to make the majority of its sales on Steam, since users are not incentivized by prices to multihome.

---

<sup>463</sup>  $(\$10 \times (1 - 30\%)) / (1 - 12\%) \approx \$7.95$ .

- (172) Without their ability to compete on price and/or content, those platforms will not be able to attract users away from Steam. Without a large user base, those platforms will not be able to attract publishers away from Steam, even with lower priced commission structures. As such, Valve’s PMFN Policy and active enforcement acts as an additional barrier to entry for other platforms to enter the market and compete effectively with Steam.

## 5.2. Enforcement of the PMFN Policy

- (173) Valve enforces its PMFN Policy on both pricing and content to ensure parity on Steam. Valve maintains its monopoly power and deters potential competing platforms from entering and competing effectively in the relevant market with this continued enforcement of the PMFN Policy.

### 5.2.1. Valve’s early enforcement of the PMFN Policy

- (174) Valve’s Steam Business Team is responsible for implementing and enforcing its PMFN Policy, including detecting violations of the PMFN Policy.<sup>464</sup> When that occurs, the Steam Business Team typically reaches out to the game publisher to start a “conversation” about the discrepancy.<sup>465</sup> Steam Business team member DJ Powers testified that it was Valve’s practice

How about content issues? What content is being made available by publishers on Steam? A. I’m not sure what you’re asking about the content. I’m sorry. Q. Well, the -- well, let me ask you. In your communications with publishers over the years, have you had conversations with them about what content they make available on the Steam platform? A. Yes. Q. And have you had conversations with them about the need to make the same content available on their version of the game sold on Steam as they do elsewhere? A. That wouldn’t come up frequently, but, yes, it has come up. Q. Okay. And in the dozen or so people, approximately, that communicate with publishers regularly, have you had conversations with them about the need to ensure that publishers are making the same basic content available on Steam as they do on other -- in other locations? A. Yes. Q. Okay. And have you had conversations with that dozen or so approximate people about the publishers’ need to provide similar pricing on Steam as they do elsewhere? A. That wouldn’t be a common topic for us to discuss, but it has come up over the years, yes. Q. You’ve specifically spoken with other people within Steam about the fact that publishers need to offer similar prices on Steam as they do elsewhere; right? A. Yes. Q. Okay. And you’ve discussed with them that this is not limited to situations where the publishers are offering games for sale via Steam keys but just period; right? A. Yes. . . . Q. to initiate such a “conversation” when Steam believed that a “game [was] being sold on another platform for a lower price.”<sup>466</sup>

- (175) Evidence suggests that Valve began enforcing price parity at least as early as 2009. In November 2009, [REDACTED] was preparing to release a major game—[REDACTED]—that coincided with [REDACTED].<sup>467</sup> In emails between [REDACTED] and Valve, Valve personnel noticed other stores—notably [REDACTED]—were offering lower prices to customers purchasing [REDACTED].<sup>468</sup> Alden Kroll, a member of the Steam Business Team, reached out to [REDACTED], stating:<sup>469</sup>

We see that [REDACTED] street price for [REDACTED] appears to be [REDACTED] lower than you are asking us to sell the game for, Both [REDACTED] are selling for [REDACTED]. Can we get closer to this price on Steam? We’re happy to show [REDACTED] as the suggested price grayed out with a price of [REDACTED] next to it. We don’t need to be the cheapest option, but we need to at least be close to what customers can get the game for everywhere else.

- (176) [REDACTED] wrote back and explained “it will not be possible for [REDACTED] to change the price” on the alternative stores.<sup>470</sup> Steam Business Team member Jason Holtman explained that, in response, Valve will “opt not to carry or market [REDACTED] in [REDACTED] on Steam.”<sup>471</sup> Valve later internally confirmed that “[REDACTED] will not launch in [REDACTED]”<sup>472</sup>

- (177) Delisting a game from Steam is a powerful enforcement mechanism. In this example with [REDACTED], delisting [REDACTED] resulted in the loss of all [REDACTED] sales. Valve was willing to completely remove the [REDACTED] title in [REDACTED], opting to forego the 30% commission Valve would have collected on [REDACTED] sales in order to enforce Valve’s price parity policy.
- (178) In the several years following Valve’s delisting of [REDACTED] games continued to be sold at lower prices on other platforms than on Steam, and Valve continued to enforce its PMFN Policy against [REDACTED] as a result. In a series of emails in March 2010, Valve notified [REDACTED] that [REDACTED] games [REDACTED] and [REDACTED] would not be offered on Steam in [REDACTED] “because they are not competitively priced[.]”<sup>473</sup> In the same email chain, Valve began referring to the phenomenon of publishers offering lower prices on other platforms as the “[REDACTED] pricing issue.”<sup>474</sup> Valve took the position that allowing lower prices on other platforms would mean that Valve is “essentially advertising to [its] customers that Steam is not competitive with regular price.”<sup>475</sup>
- (179) In March 2014, [REDACTED] wrote to Valve and explained that retailers in [REDACTED] were attempting to price lower in order to be “cheaper than their competitor,” i.e., Steam.<sup>476</sup> [REDACTED] explained that they “are not responsible” for this strategy and that “pricing in [REDACTED] has been historically very aggressive[.]”<sup>477</sup> [REDACTED] proposed that if Valve wanted to control pricing in

Valve again removed “[those] games off sale in [REDACTED] until pricing [was] comparable.”<sup>484</sup> Valve noted that, ultimately, [REDACTED] “brought pricing to parity.”<sup>485</sup>

(181) By at least 2015, Valve was also frequently enforcing the PMFN Policy against publishers other than [REDACTED]. A 2015 internal Valve email by DJ Powers, which included a group email address encompassing all members of the Steam Business Team, explained that Valve had just enforced the PMFN Policy against [REDACTED] based on the price of another major game, [REDACTED]: “We’re going to remove the purchase offer for [REDACTED] today. We’ve asked [REDACTED] to list a competitive price to what we’re seeing at other retail outlets, and they’ve said they are unable to do so.”<sup>486</sup> Mr. Powers also explained that the same type of enforcement occurred against another publisher, [REDACTED]: “The [REDACTED] is in a similar position, and Ricky is talking through solutions with [REDACTED].”<sup>487</sup> Finally, Mr. Powers noted “I checked through our upcoming AAA titles and we appear to be priced competitively to retail on everything else.”

(182) As another example, [REDACTED] noted that [REDACTED] retailers were attempting to offer [REDACTED] [REDACTED] at a lower price than Steam in 2015: “The problem with the pricing has been caused by some retailers in [REDACTED] attempting to undercut and run [REDACTED] [REDACTED] as a loss leader[.]”<sup>488</sup> Despite [REDACTED] assurance that it was not “offering [REDACTED] retailers] a reduced [wholesale sales price] in order for them to go out at these lower price[.]” Valve pressed [REDACTED] “to update the offering on Steam so it is comparable to other offerings, whether by price or content[.]”<sup>489</sup> After further pushback from [REDACTED],

(184) Valve’s PMFN Policy and enforcement is worldwide.<sup>496</sup> For example, in July 2012, a Valve employee reached out to [REDACTED] regarding a difference in discounts between Steam and the developer’s website and threatened to remove discounts from all of the developer’s games, including a daily deal opportunity.<sup>497</sup> Later in the chain, in emails between Valve employees, one employee discusses Valve’s approach to price parity enforcement: “If we allow this type of behavior: where we give steam keys away and then you sell the ones we gave you for less than you allow us to sell ours . . . it sets a bad precedent. It encourages our customers to shop elsewhere. . . . I think we should try to set in the minds of our customers

that if a game is on Steam, Steam is the place to get it.”<sup>498</sup> As another example, in February 2015, Steam Business Team member Tom Giardino went to Japan and noticed certain PC games were available at retail outlets at lower prices than Steam.<sup>499</sup> Mr. Giardino circulated a chart of approximately thirty games, designating which games could be found at a lower price elsewhere relative to the Steam price, and stated that this chart would create “good ammunition for partner conversations.”<sup>500</sup> See Section 5.2.2 for more examples.

### 5.2.2. Valve’s continued enforcement of the PMFN Policy

- (185) Valve has enforced its PMFN Policy throughout the class period when it has found price or content parity violations. Valve did so even when the perceived parity violations were minor. These PMFN enforcement actions blocked effective platform-to-platform competition and restricted the ability of competing platforms to steer customers to lower-cost alternative distribution options. As a result, Valve avoided having to compete on price or content and insulated itself from competitive pressures that would have caused Valve to reduce its commission structure to competitive levels.

#### Enforcement of price parity

- (186) There are numerous instances where Valve applied its PMFN Policy to stop game publishers from listing games at lower prices through other websites or rival platforms. Connor Malone, a Valve employee,<sup>501</sup> testified that he was unaware of any instances where Valve knowingly

PC games at retail in Japan are a sad and lonely thing, usually relegated to the far corners of stores. Some of the prices are wildly high because they haven’t been updated in months or years, but there’s some useful data in the prices of newer releases. It’s also good ammunition for partner conversations. In most cases, Steam pricing is better than the Japanese retail pricing I found, but this was only across 3 to 4 different stores. Games that are listed multiple times were found at different stores with different prices. When the retail price was dramatically better than ours, I highlighted in red.”)

allowed these types of price discrepancies to occur.<sup>502</sup> Valve employees even developed a “quick text” template email to expedite writing emails to publishers to communicate why a Steam Key request was denied. The emails states that “it’s important to us that Steam customers get treated fairly relative to how you’re selling the game on other stores” and “we’d be concerned if the game is going to be offered at a much better price somewhere else and want the opportunity to match the offer or provide a similar/equivalent discount.”<sup>503</sup>

(187) In internal conversations, members of Valve’s Steam Business Team confirmed price parity was regular policy. For example, Tom Giardino, a Steam Business Team member,<sup>504</sup> described Valve’s pricing parity requirement as “a platform goal that goes beyond Steam keys[.]”<sup>505</sup> He stated: “[I]f a game is being sold through some other PC platform, or sold DRM free or whatever the case may be, we want the chance to compete fairly and get that lower price for our customers. Steam keys are sort of a distraction here-- if a store stopped selling keys tomorrow but kept offering better prices than we were able to get for our own customers, that would still be a fundamental problem for us.”<sup>506</sup> In a different internal conversation, Mr. Giardino reiterated “we have a philosophy which is; don’t make Steam a disadvantaged place to buy your game[.]”<sup>507</sup>

(188) For example, in discussions with developer [REDACTED] about its game [REDACTED], Mr. Giardino gave a warning on pricing parity: “The big thing we push back on is pricing parity – if you sell for \$5 on your own website but \$15 on Steam, we want to match that lower price so that any

(189) In 2016, DJ Powers discussed Valve’s price parity policy after developer [REDACTED] sold its game on another platform for a better price.<sup>510</sup>

I told [REDACTED] it was bullshit to offer a higher discount on another platform, one week after our summer sale. We gave them a ton of exposure, sold [REDACTED] units and [REDACTED] worth of their game, only to have them beat the discount one week later. I said that in future sales we would like to know if they intend to beat Steam discount elsewhere shortly after or during our sale, because it will likely change how we choose to expose that title on Steam.

(190) Valve actively enforced its price parity policy with publishers. For example, Valve pulled a publisher’s takeover marketing if the publisher did not lower its price on Steam to match the price offered elsewhere: “We’ve come across a number of sites selling the game for significantly lower than the Steam price and we’re concerned about promoting a launch while the game is easily available at better prices elsewhere. Our concern is about offering our customers a competitive market price, and unfortunately it looks like the price on Steam is out of line with the rest of the market. We will be unable to run a takeover for the game on launch given these circumstances.”<sup>511</sup> As discussed in Section 3.3.3, takeovers are the highest level of marketing featuring on Steam, and the marketing benefits from takeovers are very important to those publishers who are chosen. Valve punished the publisher for not following the price parity component of the PMFN Policy by revoking a key marketing opportunity on Steam.

(191) Other examples of Valve discussing the price parity policy with publishers and enforcing that policy include:

a. In an email to a publisher (2018), Valve stated that “we really need to discuss your game’s relationship with Steam and other platforms[;]” Valve is troubled by “[your] offer on Discord being different from the offer on Steam.”<sup>512</sup> Valve went on to warn the publisher that “[i]f

you can't offer Steam customers the same deal as customers on other platforms, then we're not going to be able to continue selling and promoting the game.”<sup>513</sup>

- b. In an email correspondence with a publisher (2018), Valve told the publisher that “[w]e basically see any selling of the game on PC, Steam key or not, as a part of the same share PC market- so even if you weren’t using Steam keys, we’d just choose to stop selling a game if it was always running discounts of 75% off on one store but 50% off on ours. ([Steam] Keys happen to be tied up in a lot of conversations, but they’re pretty irrelevant to the root concern: treat Steam customers fairly).”<sup>514</sup>
- c. In an email exchange (2021), Valve told a publisher that “[w]hat’s important to us is how customers get treated- as the [Steam] documentation indicates, we want to make sure people buying on Steam get treated fairly compared to people buying the PC version anywhere else (whether or not that's via steam key!)”<sup>515</sup>
- d. In an email chain (2022), a publisher asked Valve to run a promotion for their game at the same time as the game would also be part of a key bundle to benefit charity, in order for the discounts to line up.<sup>516</sup> Valve remarked that for bundling games, “the big thing to think about is price—using Steam keys to sell on other stores is fair play, but it’s under the precondition that Steam customers aren’t getting screwed over on price[.]”<sup>517</sup> Valve reminded the publisher about the price parity policy, stating that “if you want to offer a super low discount elsewhere,” Valve wants “Steam players to get that super low discount too[.]”<sup>518</sup>

(192) While Valve vouches its concerns about price parity in terms of “fairness”, the effect of the PMFN is to limit the ability of a developer to attempt to move users to a different platform, prevent a (potential) competitor from offering price inducements/support to developers to encourage lower pricing as a means of inducing developers and users to the new platform, and place the cost of price parity compliance on the developer. Whether Valve’s “concern” for fairness is real or pretextual, the impact is to deny both developers and gamers the benefits of cross-platform competition.

**Enforcement of content parity**

- (193) Valve’s SDA imposes a contractual requirement of content parity for all games sold on Steam. This prevents developers from adding any features to their games elsewhere that they do not offer on Steam.<sup>519</sup> Valve claims that that the content parity creates cohesion and “for [Valve’s] customers to be contained within the Steam ecosystem.”<sup>520</sup> In sum, Steam would rather not

Kassidy Gerber, Dep. Tr., 10/5/2023, at 45:14–46:12. (“Q. Ms. Gerber, during the time you’ve worked at Valve, did Valve have a policy to require material parity for things sold on the Steam store? A. I would not describe what we do as a policy, but in practice, we ask that partners have material parity for their games on Steam between other PC versions. Q. What does “material parity” mean in this context? A. It means the game you offer on Steam has to be comparable, as good as any other version -- any other PC versions. Q. The -- having additional play time that’s not available on Steam, but is available on another PC store, would be a -- would be a, I think, in my opinion, violation of material parity, yeah.”)

A series of emails discussing SDA negotiations with developer ██████ demonstrate Valve’s commitment to uphold content parity. In response to ██████ attempting to negotiate the material parity stipulations, Valve states: “Unfortunately, we don’t think we can agree to what you’re proposing. If a game on Steam is going to be materially different from the game on other PC platforms, we’d rather just not have the game on Steam in the first place[.]” After receiving this email, ██████ agrees to “revert to [Valve’s] original [material parity] language[.]” In the same email thread, ██████ also attempts to push back against Valve’s standard policies relating to material parity ██████. Valve responds similarly, and NCSOFT agrees to move forward with the agreement without its proposed revisions relating to ██████. See:

(196) Other examples of discussion and enforcement of Valve’s content parity with publishers include:

- a. In an email regarding setting up the storefront (2021), developer [REDACTED] asked Valve about offering different content on [REDACTED].<sup>529</sup> Steam’s Business Team declined this request, and told [REDACTED] that “it wouldn’t be OK to sell the game on Steam, but make a DLC available exclusively on other PC stores, whether or not you delivered the DLC via Steam Key[.]”<sup>530</sup> The email also stated: “If we can’t offer the product fairly to our own customers, we’d just choose not to sell it. We aren’t interested in doing business with somebody if they give Steam customers bad treatment on price or content, regardless of what’s in the [SDA].”<sup>531</sup>
- b. In a response to a publisher inquiry about selling a game on Steam (2022), Valve remarked that “[t]he main goal for us is just making sure that once we’re *selling* on Steam, we’re able to put the same offers in front of Steam users as you’re making elsewhere on PC.”<sup>532</sup>
- c. Kassidy Gerber, Valve employee, testified (2023) that when Steam publishers promote content (games, DLC, etc.) on competing platforms but not on Steam, Valve has several punitive options, including delaying their curated promotion on Steam and removing their games from Steam, demonstrating that Valve exercises and maintains its monopoly power as well as protect its competitive position in the PC games market.<sup>533</sup> Later in her deposition, Ms. Gerber discusses an example where Valve threatened to remove a [REDACTED] game because [REDACTED] didn’t offer the game’s starter pack on Steam even though it was

It depends. Q. You might take down their game? A. We might delay some curated promotion. We felt that it wasn’t a fair offer on Steam to only have them -- like, more premium editions of this game available when we knew that there was a compelling starter edition that we didn’t have. We thought it was bad to continue promoting this game like we had a complete offering when we didn’t. . . . Q. ## 6. Anticompetitive Effects of Valve’s Monopoly Power

---

### 6.1. Valve’s supracompetitive commission rate to publishers

- (197) As discussed in Section 4.2.2, Valve’s monopoly power allows it to set and sustain a supracompetitive commission rate that publishers must pay to secure distribution of their games on Steam. Steam’s more direct competitors—EGS and the Microsoft Store—charge publishers commissions of 12% in comparison to Steam’s 30%. While benefiting Valve, the supracompetitive commission rate harms competition in the relevant market.
- (198) Valve recognizes that its commission rate and the resulting so-called revenue sharing arrangement is an issue with publishers.<sup>536</sup> In a Valve competitor analysis for the 2020 GDC and an accompanying email, Valve acknowledges that EGS is “[d]oing [w]ell” from the developers’ perspectives on revenue sharing.<sup>537</sup> Given the survey and other evidence, it appears that publishers agree.<sup>538</sup> At least as early as 2018, Valve employees noted that “[p]retty much everyone agreed that Steam wasn’t worth 30%” of revenue and that “Steam hasn’t had to compete, and thus has gotten lazy and hasn’t had to change revenue share[.]”<sup>539</sup> Developers stated that they would leave Steam if a competitor platform “comes along and offers a better deal” and that, for example, they “would be less likely to take a deal from another platform for exclusive distribution” if Valve “took a smaller share” of revenue.<sup>540</sup>
- (199) Additional documents support the same conclusion.<sup>541</sup> For example, in an email chain between Valve and ██████ regarding ██████ launch on Steam, Valve alerted ██████ about

(A Valve employee internally emailed a quote that read “Epic undercuts Steam with new store that gives dev[eloper]s more money[,]” to which another employee replied that “88/12 [revenue sharing] is a super powerful message[,]” and Epic is “going to make a bunch of headway with that. Steam needs to outperform then [sic] with actual sales (and maybe rethink our own rev[enue] share approach across the board?).” Further, another employee remarked that [REDACTED]

Valve, Email Regarding Developer Meeting Notes, 1/25/2019 (VALVE\_ANT\_2417190–93, at VALVE\_ANT\_2417191–93). (An email regarding notes for developer meetings remarks that Epic’s 88% revenue share will excite developers and that “Epic is going to have success convincing dev[eloper]s to ship content on their store under these terms[,]” the actions “Steam/Valve [is] taking in reaction to all of this” is “[t]aking a fresh look at our revenue share and re-shaping it to reward the biggest games on Steam that provide incredible network effects to the platform[,]” “[a]ggressively continuing to grow the platform into new territories[,]” and making developers’ “decision to leave Steam as difficult as possible.”)

Deep Silver publisher’s game, Metro Exodus, had been available on Steam in 2019 for pre-order at \$59.99 but was removed before its release and offered on Epic for \$50. However, Deep Silver would still fulfill pre-orders that had been made on Steam. Epic’s “competitive revenue split of 88/12 [was] hinted to be the reason behind the leaner price [on Epic,]” as Deep Silver’s CEO, Klemens Kunderatz, remarked that “Epic’s generous revenue terms are a game changer that will allow publishers to invest more into content creation, or pass on savings to the players.” In a series of email exchanges that discuss Deep Silver’s decision, a Valve employee notes that “cutting price from \$59.99 to \$50 seems like it may actually make some customers happy[,]” and questions if it’s worth to Steam customers “paying \$10 more [on Steam.]” They remark that “customers are going to buy the product where it’s on sale[,]” they ask if Valve should match the “lowest price” and “take the loss and retain the player,” because in the future, “the loss is shared by the publisher.” See:

In an email regarding talking points for a meeting with developer, Valve recognized that most developers would “come into that meeting thinking, ‘Wow, crazy year with all that Epic stuff. How are things going?’” and instead of highlighting how “we react[ed] internally to Epic[,]” “[we should] look back at some of the work we’ve done in 2019[.]” Valve went on to point out that the question Valve should be ready for is if “Steam [is] going to change [revenue share] terms in a material way because of Epic disruption[,]” the answer to which is Valve already changed its revenue share in 2018. However, Valve’s acknowledgement in its 2020 GDC talking points that Valve was falling short in terms of “[i]ssues with Rev[enue] Share” demonstrates that publishers were not satisfied with Valve’s new revenue share policy. See:

On its face, this is evidence of Valve’s monopoly power.

(200) After Valve restructured its commissions to tiers, its commissions remained supracompetitive, and developers, especially the smaller ones, had no viable switching option to even threaten to defeat that structure. Valve acknowledged that the new revenue share benefits only top earners, stating that “[REDACTED]

██████████. Particularly in the wake of the SDA changes that specifically benefit our top revenue earners, I don't think it's a great look.”<sup>547</sup>

- (201) Valve understood that publishers felt Steam’s fees, even when adjusted to the tiered revenue structure, were too high. In a series of emails regarding Valve’s new revenue share, a Valve employee shared a quote from an article which states that Valve’s “30-percent revenue cut is steep, especially given how little Valve does to earn it nowadays.”<sup>548</sup> In an email regarding meeting with ██████████ about the new revenue share, Valve noted that “██████████ folks were pretty ‘stoic’ and so not a lot of reaction on the proposed new rev[enue] share[,]” and that after the meeting, Scott Lynch of Valve said that ██████████ “immediately” went into ██████████ ██████████<sup>549</sup> An internal email notes that Valve gave ██████████ “a pitch for the interesting things we could do together if ██████████ games came to Steam[,]” and ██████████ ██████████ ██████████ ██████████ ██████████<sup>550</sup> Valve had no compulsion to respond to or alter terms since the evidence indicates it knew ██████████ had no realistic alternatives that could threaten Steam’s dominant position.

- (202) Additionally, the commission rates charged by other digital platforms support my conclusion that Steam has monopoly power and that the rates it sets are supracompetitive. Per Epic, “[t]he 70% / 30% [revenue] split was a breakthrough more than a decade ago with the advent of Steam,” but today, “digital software stores have grown into a \$25,000,000,000+ business worldwide across all platforms, yet the economies of scale have not benefited developers.”<sup>551</sup> Epic notes that “[i]n our analysis, stores charging 30% are marking up their costs by 300% to 400%. But with developers receiving 88% of revenue and Epic receiving 12%, this store will

still be a profitable business for us.”<sup>552</sup> Following Epic’s announcement of EGS and the associated 12% commission rate, Microsoft followed suit in 2021 by cutting the commission it charged on Microsoft Store from 30% to 12%, stating that it wants developers to “find success” on its platform, so a “clear, no-strings-attached revenue share means developers can bring more games to more players and find greater commercial success from doing so.”<sup>553</sup> For further discussion, see Section 7.4.

- (203) Valve maintains this supracompetitive commission rate because of its PMFN Policy. Absent the PMFN Policy, other platforms could charge lower commission rates to publishers to incentivize them to join that competing platform, and the publishers could charge lower prices to entice gamers to the new platform. This could be done using lower prices or different, desirable content not available on Steam. However, due to Valve’s PMFN Policy, publishers that list on Steam cannot offer different prices—despite facing lower platform fees on those platforms—or content on other platforms.

## 6.2. Harm to ability of entrants to effectively compete

- (204) Entrants into the relevant market have been unable to compete effectively with Steam; no entrant has been able to achieve meaningful success in the marketplace or gain and maintain a meaningful market share. Despite other third-party digital PC game distribution platforms offering developers benefits similar to Steam and charging lower commissions than Steam, Steam maintains its dominant position in the relevant market. According to an article from PC World, “Amazon, GOG, Humble, and Microsoft have tried to take on PC gaming’s 800-pound gorilla and all largely failed to shake up the status quo.”<sup>554</sup> Further, according to a report emailed to Valve in 2022, “[m]any companies have tried without success to compete against Steam. This includes large publishers like EA. The most notable recent attempt is from Epic Games, the developer behind Fortnite and the Unreal Engine. Epic’s main attraction is a 12% commission for developers.”<sup>555</sup>

<sup>555</sup> Valve, Email Regarding PC Game Distribution, 10/18/2022 (VALVE\_ANT\_1225364–78, at VALVE\_ANT\_1225365).

- (205) The inability of entrants to successfully compete with Steam is a direct result of the monopoly power that Valve has acquired and maintained through the enforcement of its PMFN Policy. As discussed in Section 5.2, Valve’s PMFN enforcement has historically restricted the ability of competing platforms to attract customers to lower-cost alternative distribution options and continues to do so. New platform entrants must convince both publishers and users to join their platforms and “amass a critical mass of users on both sides [of the platform].”<sup>556</sup> The PMFN Policy establishes an insurmountable barrier.
- (206) The PMFN Policy effectively forecloses the paths that entering platforms could follow to compete effectively and on the merits with Steam. One option for potential entrants would be to offer lower commission cost options for publishers to incentivize them to charge lower prices on the entering platform. This would entice both publishers and users to the platform. The PMFN Policy blocks this path. A second option would be to provide content not available on Steam to differentiate the platform. Without a PMFN, this task is, at best, a challenge. With the PMFN Policy, the pathway is blocked. With the PMFN Policy in place, Steam effectively removes both avenues of competition as options and makes the impediment to effective entry a barrier that cannot realistically be overcome.
- (207) Steam has amassed a significant base of both users and developers on either side of its two-sided digital platform. As of 2021, Steam had approximately 132 million monthly active users.<sup>557</sup> As of early 2024, there were over 57,000 publishers and approximately 90,000 games on Steam.<sup>558</sup> Meanwhile, other potential competitors who have entered the digital PC gaming distribution market have been largely unsuccessful in gaining a significant share of users and/or developers. - a. Itch.io, which launched in 2013, was able to create a digital platform with 200,000 games as of 2019.<sup>559</sup> However, Itch.io struggled to build a significant user base. As of 2019, Itch.io had a user base “in the tens of thousands” as opposed to the tens of millions on the Steam platform.<sup>560</sup> As such, in 2021, Itch.io joined EGS in order to “widen the audience of people who can discover the diverse collection of indie works that we host.”<sup>561</sup>
- b. GOG Galaxy, which launched in 2014,<sup>562</sup> differentiates itself by recovering, restoring, and selling classic video games originally developed years ago, while also offering a curated collection of new games.<sup>563</sup> In 2020, GOG offered more than 4,700 products through its platform.<sup>564</sup> Today, GOG offers more than 9,000 products through its platform.<sup>565</sup> However, GOG Galaxy needed to rely on another competitor to help amass a user base, becoming available for download from EGS in 2022.<sup>566</sup> Although GOG Galaxy does not publicly release its number of users, in 2023, it had only over 1,200 publishers and developers worldwide.<sup>567</sup>

(208) Several competitors were able to initially amass nontrivial participation on both sides of the platform; however, those platforms ultimately have been unable to sustain any success or to attain/maintain a significant share of the market because of Valve’s PMFN Policy. For example, EGS was launched in late 2018 with a goal to “bring [gamers] great games, and to

- (209) Despite these efforts, EGS did not alter the competitive balance in the market; Steam remains the dominant firm. Valve has not lowered its prices to competitive levels, and it has not changed its anticompetitive policies. In fact, EGS struggled to be an effective competitor to Steam. While EGS grew its userbase from 108 million users in 2019 to over 230 million users in March of 2023[,]<sup>575</sup> it failed to attract sufficient publishers/games to offer a meaningful competitive threat. Epic was only able to increase the number of games offered on EGS from 190 in 2019 to 917 in 2021.<sup>576</sup> In 2022, this number rose to 1,548 games.<sup>577</sup> Steam, by comparison, had approximately 1 billion registered Steam accounts in October of 2020,<sup>578</sup> and had approximately 90,000 games on its platform as of early 2024.<sup>579</sup>
- (210) The majority of EGS’s revenue was attributable to its own games, not third-party games. competitive market unencumbered by an enforced PMFN.<sup>590</sup> However, with Steam’s PMFN Policy firmly in place, while publishers may benefit from the low fees on these platforms, the users *do not* gain cost savings through lower game prices. That is, if a publisher were to publish its game on Steam and a competing low-cost platform, *e.g.*, EGS, the price parity requirement of the PMFN Policy prevents that publisher from passing through those cost savings to a customer in the form of a lower game price. Without that lower price, users have no incentive to move to the low-cost option. Absent the PMFN Policy, Steam would need to compete on the merits across all relevant dimensions for developers and users. The PMFN Policy prevents that from happening.

- (213) Thus, Valve’s monopoly power and network effects that are maintained through its PMFN Policy prevent new platforms from competing effectively. They can also lead to those platforms’ publishers having to *rely* on Steam’s platform and large user base to stay afloat. For example, in 2009, Ubisoft launched an online platform (formerly named Uplay), which in 2013, began offering third party games on the platform “to give Uplay’s 50 million users more option for buying and playing Ubisoft games.”<sup>591</sup> While the Ubisoft platform was able to overcome initial barriers to entry and amass millions of users through the release of *Assassin’s Creed 2*, which was released with the Uplay platform,<sup>592</sup> Ubisoft eventually expanded its game offerings on Origin, Steam, and EGS.<sup>593</sup> In 2019, Ubisoft reversed course and stopped releasing new games on Steam, instead focusing only on EGS and Ubisoft Store.<sup>594</sup> Ubisoft claimed that Steam’s business model was “unrealistic” and “doesn’t reflect where the world is today in terms of

games distribution.”<sup>595</sup> However, this strategy was unsuccessful and ultimately short-lived, as several Ubisoft exclusives were later released on Steam.<sup>596</sup>

(214) Ubisoft’s reliance on releasing its games on Steam despite having over 117 million active players across consoles and PC in 2020 demonstrates the lack of meaningful competition to Steam in the market for third-party digital PC game distribution via platform.<sup>597</sup> Despite Ubisoft’s ability to enter the market and Steam’s supracompetitive prices, it could not meaningfully compete without offering its own games on Steam’s platform. Moreover, the need to distribute its games through Steam *prevented* Ubisoft from competing with Steam on game price on its *own* platform because of Steam’s PMFN Policy. Thus, a competitive challenge to Steam’s supracompetitive pricing was thwarted.

(215) EA, a major game publisher responsible for popular game series such as *The Sims* and *Battlefield*,<sup>598</sup> is another example of a platform that attempted and failed to compete against Steam. [REDACTED]

That long nightmare finally comes to an end on November 15, with a joint Steam and Origin release of the next big *Star Wars* action game.”)

EA ultimately returned to distributing their games on Steam.<sup>608</sup> In 2020, EA began relisting its games on Steam, taking a more “open” approach and claiming this was “the most player-first thing [they could] do.”<sup>609</sup> EA’s Senior Vice President commented on the return, stating that “we are game makers, and our aspiration is to connect as many people as we can to the great games that we built[,]” thus “we want to be [on Steam] where the players are.”<sup>610</sup> In 2022, when EA launched the EA App, EA stopped selling games from third-party publishers.<sup>611</sup> Another competitor was lost in the market.

- (217) EA’s decision to return to publishing its games on Steam also meant that Steam users now had access to additional third-party PC games, further encouraging users to choose Steam over other platforms. As was the case with Ubisoft, when EA relisted its games on Steam, it was then also bound by Valve’s PMFN Policy. EA thus could not compete on price or content with Steam, *even with its own games on its own platform*. EA’s reliance on Steam demonstrates the lack of meaningful competition to Steam and that the PMFN Policy prevented effective competition with Steam.

- (218) In 2012, Microsoft launched a digital distribution platform known then as the Windows Store.<sup>612</sup> However, in 2019, Microsoft decided to distribute games through Valve’s Steam platform.<sup>613</sup> Even Microsoft, one of the world’s largest software makers,<sup>614</sup> could not succeed on its own in the PC desktop gaming distribution market without offering games on Steam, given the need to publish its games where the vast majority of users are. Even when facing Steam’s supracompetitive prices, Microsoft needed to rely on Steam because of Steam’s dominance. Microsoft’s reliance on Steam allowed Valve to maintain or grow its monopoly power in the relevant market. Once Microsoft brought its games (and more users) back to Steam, Valve’s PMFN Policy protected Steam from competition from Microsoft.
- (219) These examples show that the PMFN Policy enforcement protects Steam from meaningful competitive threats by preventing those competing platforms from building the network effects that would allow those platforms to challenge Steam. Valve’s PMFN Policy prevented those publishers from competing on price to attract users away from Steam. Without the ability to use price as a means to attract users and the corresponding difficulty in attracting developers, all three platforms (Uplay, Origin, and the Window’s Store) were unable to compete effectively and provide a competitive challenge to Steam.<sup>615</sup>

<sup>615</sup> Not only do some third-party digital PC game distribution platforms need to put their games on Steam in order to maintain their respective platforms, but some third-party digital PC game distribution platforms, especially the non-gaming platforms, are reliant on Steam Keys and other keys, making them beholden to Steam. Steam has discretion in how many Steam Keys it will grant to publishers, and Steam Keys have been denied if a publisher prices its games too low relative to Steam, again stopping publishers from competing on price due to the PMFN Policy. See Sections 5.1 and 5.2.

For example, Humble relies on Steam (and other third-party distributors) for the actual hosting and distributing of games. Instead of purchasing and playing the game directly through Humble, users purchase keys to games on the Humble Store that need to be redeemed on a gaming platform such as Steam, Ubisoft Connect, or GOG. ### 6.3. Reduction in variety, quality, and innovation

- (220) Steam’s anticompetitive conduct has led to a reduction in the variety of platform features available to consumers and game developers. Platforms are differentiated: each platform must make decisions about the overall aesthetic of their website or app, how reviews are handled, which games are added to their platform, how those games are displayed to consumers, and what type of content moderation (if any) exists.<sup>616</sup> Competition would yield a set of platforms with different features, attributes, and quality.<sup>617</sup> Valve’s conduct prevents viable alternatives from entering the market and offering publishers and consumers choices and the prospect of innovation.
- (221) As the dominant platform, Steam is able to “shape the nature of competition” in the market for third-party digital PC game distribution via platforms.<sup>618</sup> Steam’s choices about the platform influence the types of products consumers choose and developers create.<sup>619</sup> Because Valve insulates itself from meaningful competition from other platforms that present consumers and developers with different experiences, the range of choices in the relevant market is limited and opportunities for innovation are stifled.
- (222) Steam’s PMFN Policy prevents developers from differentiating themselves via price and/or content, making it a challenge for developers to induce users to join new platforms with price and/or content incentives. This limits the entry and growth of competing platforms that may offer different features or qualities that could be preferential to certain publishers and/or

<sup>617</sup> Many platform features are mutually exclusive, e.g., enabling comments. If users do not all agree on which choice is best, a single platform like Steam cannot mechanically meet all of those user preferences. See also:

gamers. As discussed herein, the challenge for developers is to find platforms where gamers can easily find, download, and play their games. While publishers are able to list on different platforms, ultimately, they need to be on Steam because of its user base. Then, by joining Steam and being bound by the PMFN Policy, these publishers can no longer compete on price and/or content on other platforms, effectively eliminating meaningful competition to Steam, and limiting the range of effective choices for both users and developers.

### 6.3.1. Reduction in platform variety and quality

(223) Many users and developers are dissatisfied with the quality of Steam’s platform and would prefer more choice in PC desktop game platforms.<sup>620</sup> For example, in a thread on Steam

Stacks of cash off the backs of unsuspecting consumers. . . . Article after article has been written about these broken products sold to people without so much as a peep from Valve on what measures it intends to do about the problem.”<sup>622</sup> In discussion of alternatives to Steam, many users commented on their dissatisfaction with Steam’s features and desire for an alternative platform, making remarks like “it seems a lot of people are searching for alternatives [to Steam;]” “[t]he only reason I use Steam is to purchase games that are unavailable elsewhere i.e. I am forced to use it if I want xyz title[;]” “[w]hen a company (Steam) has a monopoly on the entire PC gaming industry, there’s very little alternative for any potential competition to pull in customers.”<sup>623</sup> In a competitive market, dissatisfied customers have alternatives to consider. Further, in a competitive market, even satisfied customers may want to explore other options. Valve’s policies that prevent entrants from having a reasonable opportunity to compete on their differentiation prevent consumers from having choices and arguably higher quality.

- (224) In a competitive market, a platform like Steam would have to meet the needs of its customers, including publishers. Publishers have complained about issues with Steam. For example, an internal Valve document lists several grievances from game developers, including:<sup>624</sup>

- “Sales reporting site is slow and painful.”

common issues that tend to be raised by developers to you, that visibility might be one of them. Would visibility play into what we’re talking about in kind of where games are visible to potential customers? A. Well, there’s -- like I -- I think I said there’s tens of thousands of games on Steam and there’s only so many capsules you can fit on the home page, so there’s a lot of interest in getting your games seen there. So developers are very, very interested to know how they can get their games seen by more people. Always.”)

- (229) Second, other responses demonstrate that developers are unsatisfied with the mechanisms Steam uses to guide users towards games. Of the developers in the sample, 61% agreed that “[h]ours [p]layed’ is not a measure of quality[.]” and 62% agreed that “[v]isibility on Steam should not be dominated by popularity[.]”<sup>636</sup> Some questions go further towards showing a desire among developers to cater games to Steam’s recommendation system, including 68% of developers agreeing that Steam should “[a]llow developers to ‘target’ the discoverability algorithm for their game[.]” and 81% agreeing that Steam should “[c]larify what is needed for various featuring opportunities[.]”<sup>637</sup> Most developers want reviews on a game platform, with only 14% stating that Steam should “allow devs to opt-out of reviews altogether[.]”<sup>638</sup> However, many disagree with the implementation on Steam, with 71% of developers stating Steam should “separate tech issues from gameplay reviews[.]”<sup>639</sup>
- (230) Third, developers are also interested in more accessible data from Steam.<sup>640</sup> In addition to being a general feature that could vary across platforms in the but-for world, giving developers more data would allow them to better understand their customers and more confidently take risks on a game that may be a bigger departure from previous titles.
- (231) In a but-for world with more competitive platforms, publishers who do not agree with the above decisions would be more likely to find an alternative platform that fits their preferences. The absence of variety (and quality) of alternative platforms, engendered by Valve’s PMFN Policy, harms competition.

### 6.3.2. Reduction in PC desktop game variety

- (232) A video game platform helps users search for and discover games that fit their preferences. Steam’s design affects which games are displayed and advertised to users, and so limits user search effectiveness and game variety. Different platform designs favor different products, characteristics, and consumer preferences, and will not meet everyone’s preferences perfectly. Beyond a general dissatisfaction with Steam’s platform features, restricting platform variety

<sup>640</sup> For example, see Attachment F-1 at ‘Allow easy user rating export / data dump’ and ‘Provide adoption data on various features / hardware’.

ultimately restricts the variety of successful games.<sup>641</sup> This unhappiness should lead to responsive entry of competing platforms, but Valve’s PMFN Policies make successful entry by platforms seeking to address that dissatisfaction effectively impossible.

<sup>641</sup> For additional examples, see:

Valve, Emails Regarding Steam’s Review System, 1/25/2016 (VALVE\_ANT\_1166796). (An email from a Steam user states: “I’m writing an email to you out of desperation. [T]he game is critically acclaimed and liked [b]y many, it has 86% positive reviews and yet people only see negative reviews on Steam, which misrepresents the game and costs the developers and Valve both money as a result. . . . I don’t really feel encouraged to write reviews any more, since the system is so vulnerable to abuse.”)

A Valve Blog Post states that Steam wants to maximize happy customers, but they define this as customers buying more games and playing more on the platform. While not a specific platform feature, this goal likely guides their platform design. Other platforms may have alternative objectives that would lead them to make different platform design choices. For example, the GOG website states that they are a “home for building and playing your curated game collection[.] GOG is a digital distribution platform that puts gamers first and respects their need to own games.” The itch.io website states that they are “an open marketplace for independent digital creators with a focus on independent video games. It’s a platform that enables anyone to sell the content they’ve created. As a seller you’re in charge of how it’s done: you set the price, you run sales, and you design your pages.” See:

(233) For example, a publisher emailed Valve to express frustration about its games not getting exposure and Valve’s irresponsiveness, stating that “[t]he reason I contact you is because I have problems getting in touch with business developers at Valve. I know they are super busy, but who doesn’t take a shot, never scores.”<sup>642</sup> The publisher went on to say that the sales of its game “have been really disappointing[.] . . . Often we hear that our game is a ‘hidden gem’, but as you can imagine, we don’t want to be hidden.”<sup>643</sup> That disappointed publisher has no alternative but to stay on Steam. But for Valve’s policies, competition would lead to such options.

As such, Valve knows that it does not need to invest or innovate on Steam to compete for additional users and developers. The lack of competition and cycle of network effects, protected by the PMFN Policy, keep users and developers on the platform. In a but-for world with legitimate competition, Steam would be forced to innovate and adapt to consumer preferences in order to compete on the merits with other platforms, which would ultimately lead to better feature variety and choice for end users and developers.

## 7. Economic Assessment of Class-Wide Impact

---

### 7.1. Overview

(241) I have been asked to analyze whether there are common methodologies available that show all (or nearly all) putative class members were injured by Valve’s enforcement of price and content parity during the class period. The answer is yes.

(242) All major platforms that digitally distribute third-party PC games, including Valve, impose a standardized pricing structure on all publishers, typically a fixed commission rate.<sup>653</sup> Valve sets its pricing structure (most recently a tiered commission rate) in its SDA Agreement, which applies to all publishers on Steam.<sup>654</sup> Given Valve’s imposition of a standard pricing structure for publishers, if the PMFN policy is eliminated, the default commission rate would fall and that would benefit each publisher. Each publisher would only pay the new, lower, default

---

<sup>653</sup> For example, since November 2018, Steam has a default tiered commission structure. See:

Steam, “New Revenue Share Tiers and Other Updates to the Steam Distribution Agreement,” 11/30/2018, <https://steamcommunity.com/groups/steamworks/announcements/detail/1697191267930157838>.

Prior to this, Steam charged the majority of publishers 30%. See:

Scott Lynch, Dep. Tr., 10/12/2023, at 89:15–90:2, 141:15–18. (“Q. Did there come a time that Valve stopped offering [REDACTED] and instead switched to 70/30s? A. I don’t think there was this stop. I mean, eventually, deals started being 70/30 predominantly. Q. When did that start to occur? When did they become predominantly 70/30? A. That’s going way back. It could have been 2010 maybe, sometime in that timeframe. Q. And from that point forward, the deals were predominantly 70/30? A. I think from that point going forward, a lot of deals were 70/30, yeah.”; “Q. And the predominant revenue share for Steam is 30 percent; right? A. During 2018, yeah, the majority would be 30 percent.”)

As another example, Epic charges a fixed commission rate of 12%. See:

Epic Games, “The Epic Games Store is Now Live,” 12/6/2018, <https://store.epicgames.com/en-US/news/the-epic-games-store-is-now-live>. (“Our goal is to bring you great games, and to give game developers a better deal: they receive 88% of the money you spend, versus only 70% elsewhere. This helps developers succeed and make more of the games you love.”)

Similar, Microsoft charges a fixed commission rate of 12%. See:

The Verge, “Microsoft Shakes Up PC Gaming by Reducing Windows Store Cut to Just 12 Percent,” 4/29/2021, <https://www.theverge.com/2021/4/29/22409285/microsoft-store-cut-windows-pc-games-12-percent>.

For specific examples of standard SDAs, see:

Valve, SDA with [REDACTED], 1/1/2015 (VALVE\_ANT\_0020270–86, at VALVE\_ANT\_0020275). (See Section 6.1 of the Agreement.)

Note that some publishers have [REDACTED]. However, these publishers too would benefit from a lower default rate. See Section 7.5.1.

commission rate. Thus, all, or virtually all, class members were injured provided that an economic analysis shows Valve’s commission rates would decrease in a world free of Valve’s PMFN Policy.

(243) This question of whether there is class-wide impact can be addressed in a variety of ways. In this case, I used three distinct economic approaches to consider whether common class-wide evidence can show class-wide impact. Each of these three approaches establish that common, class-wide evidence can be used to show class-wide impact.

- Approach 1: I construct and apply a model based on economic theory derived from the relevant, peer-reviewed economic literature and applied to the facts and circumstances of this market. I use this model to show that Valve’s parity enforcement harms all or virtually all members of the putative class. Specifically, I adapt the work of Andre Boik and Kenneth Corts to construct a Platform Competition Model, which shows that parity enforcement by an incumbent platform like Valve leads to higher platform fees, deters entry by rivals, and increases consumer prices.
- Approach 2: I apply a “yardstick approach” to evaluate comparable markets and explain how platform fees in those other markets compare to Steam’s commission rate. Comparing prices between Steam and markets comparable across many characteristics allows for the consideration of prices but for Steam’s alleged anticompetitive conduct.
- Approach 3: I look to empirical evidence from the PC gaming market to determine the impact of limited (and ultimately transitory) outbreaks of competition. Specifically, I look to the entry of Epic’s EGS, which was a well-funded attempt at entry by one of the leading game publishers in the world.

(244) Any of these approaches, standing alone, could be used to show impact or injury to all putative class members. Because each approach leads to the same conclusion, they provide compelling evidence that Valve’s parity enforcement has a negative impact on all or virtually all putative class members.

## **7.2. Platform Competition Model approach**

(245) To assess the impact and competitive effects of PMFN-type provisions and behaviors, I draw on a model developed by Andre Boik and Kenneth Corts to assess the impact of PMFNs (the “Boik-Corts model”). The Boik-Corts model demonstrates that “PMFN clauses typically raise platform fees and retail prices and curtail entry or skew positioning decisions by potential

entrants pursuing low-end business models.”<sup>655</sup> I apply the relevant principles from Boik and Corts to construct a model that considers and incorporates the facts and circumstances of this case.

- (246) Generally, this model closely matches the facts of this case, including the characteristics of Steam and the relevant market. First, the Boik-Corts model considers two platforms,  $I$ , where  $i = 1, 2$ . In the extended model that I build on, there is an established “incumbent” firm with high costs and high demand that charges a high fee (*e.g.*, Steam), and a lower cost, low demand competitor who wants to charge a lower fee (*e.g.*, existing, past, or potential entrant competitors like GOG, EGS, EA App, and Ubisoft Connect). Like Steam and other participants in the relevant market, the platforms set a one-sided, per-transaction fee ( $f_i$ ) charged to the seller side of the market (game publishers). Boik and Corts call these fees “transaction fees.” In the discussion that follows, I refer to these fees as both transaction fees and platform fees interchangeably. These transaction/platform fees are equivalent to the commissions charged to publishers for purchases made on the Steam platform. As with Steam and others in the relevant market, the platforms facilitate transactions between sellers and buyers. In the same way that game publishers on Steam operate, the sellers in the Boik-Corts model set their own price on one or both platforms, denoted  $p_i$ , where  $I$  denotes the platform on which the price is listed. To avoid confusion with platform fees, I refer to these prices as “consumer prices.” The platforms determine if they implement a PMFN policy, which allows for comparisons of outcomes (like consumer prices, platform fees, and entry) with and without PMFNs in place.
- (247) In considering platform fees and consumer prices, Boik and Corts consider various iterations of their model. To begin, in their simplest model, Boik and Corts assume a symmetric model of demand.<sup>656</sup> While not being directly aligned with the facts of the case, this simplification leads to more concise algebraic results supporting a more generalized model. The general conclusions of this simplified model are that PMFNs increase platform fees and consumer prices.<sup>657</sup> In my analysis below, I reach the same conclusion.

<sup>656</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 111.

<sup>657</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 114. (In particular, they say that “Equilibrium fees and prices are higher when both platforms have PMFN agreements.” In my analysis, I find that the Steams PMFN increases fees in the asymmetric model.)

- (248) I build on their expanded model, which allows the platforms to face different demand functions (the “asymmetric Boik-Corts model”), as is the case here. The asymmetric Boik-Corts model closely matches the facts of the case. In the discussion that follows, I explain why the Boik-Corts model is applicable to the case and show that PMFNs in general increase platform fees. Next, I show that Steam’s PMFN reduces entry. Finally, I calibrate the model to match the facts of the case and show that developer’s economic profits would be [REDACTED] higher without the PMFN.
- (249) My Platform Competition Model is calibrated to real-world market data. In the real world, Valve has a PMFN Policy that it has enforced for many years. Accordingly, real-world data necessarily reflects Valve’s longstanding market power. The results of the model, therefore, are conditional on these market facts. Nonetheless, the model reflects a decrease in commission rate, applicable to all, or virtually all, class members,
- (250) Additionally, my Platform Competition Model demonstrates the interim impact on prices and output when a single competitor enters the market. In my damages analysis, I use the LandesPosner model to calculate the butfor commission rate in a fully competitive market, with more than two platforms competing. That model likewise confirms that all or virtually all class members are impacted by Valve’s PMFN Policy.

### 7.2.1. Platform Competition Model

- (251) In the asymmetric Boik-Corts model, differing demand functions imply that goods with the same consumer price on different platforms will sell different quantities. Costs may also vary between platforms at a given output level, and it is assumed that the platform with the higher demand incurs higher costs.<sup>658</sup> For example, at a given consumer price, the entering platform would have lower demand but also have lower per-unit costs, implying that it can offer lower fees, making it a viable competitive alternative despite a lower demand.<sup>659</sup>

---

<sup>658</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 123. (“We allow  $c_2 < c_1$ , where firm 1 refers to the incumbent. We also permit the possibility that the entrant has a lower-value offering, which results in a reduction in demand of  $x > 0$  for any given prices:  $\widehat{q}_1(p) = a - bp_1 + dp_2$  and  $\widehat{q}_2(p) = a - x - bp_2 + dp_1$ .”)

<sup>659</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 123. (“Note that lower  $x$  need not reflect an inferior platform in a general sense; it is a platform that faces lower demand at given prices, but this may be accompanied by lower variable or fixed costs that make the entrant quite a viable competitor and a potential contributor to total welfare. Similarly, a lower cost need not make a firm a superior creator of value if it is accompanied by a demand disadvantage.”)

- (252) More formally, like the asymmetric Boik-Corts, my model includes a seller (*i.e.*, the game publisher) who sets its own consumer prices,<sup>660</sup>  $p_i$ , on each of two platforms  $i = 1, 2$ .<sup>661</sup> Consumer demand across platforms 1 and 2 is described by the following equations:<sup>662</sup>

$$q_1(\mathbf{P}) = a - bp_1 + dp_2$$

$$q_2(\mathbf{P}) = a - x - bp_2 + dp_1$$

- (253) These demand curves allow for the publisher’s price on one platform to impact consumer demand on the other platform, without assuming that buyers would choose only to purchase from the cheapest option.<sup>663</sup> The  $x$  term allows for one platform to have a “lower-value offering, which results in a reduction in demand of  $x > 0$  for any given [consumer] prices[.]”<sup>664</sup> Lower-value, in this case, does not imply that a platform is inferior; rather, lower-value refers to a “platform that faces lower demand at given [consumer] prices, but this may be accompanied by lower variable or fixed costs that make the entrant quite a viable competitor and a potential contributor to total welfare.”<sup>665</sup> This asymmetric demand assumption in my model better aligns with consumer demand in the real world, in which consumer quantity demanded may vary across platforms even if a game is listed at the same consumer price.
- (254) In this asymmetric demand model, a single PMFN can be binding (*i.e.*, consumer prices on the PMFN-bearing platform sets a floor on consumer prices on other platforms). This is the case when the established, high-fee platform (*e.g.*, Steam) implements a PMFN—prices on other

---

<sup>660</sup> In this model, there is only one good on each platform. That is, the seller lists a single game on each platform. This can be seen from the fact that there is a single demand function for each platform. Boik and Corts discuss this, saying the following “Finally, our main model features a single seller doing business through multiple platforms. In our examples, typically many sellers sell through a similar set of multiple platforms. We believe that our results apply qualitatively to this setting as well, though of course the modeling of multiproduct, multiplatform demand would make formal modeling of this case much more difficult.” See:

Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 117.

<sup>661</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 110.

<sup>663</sup> In particular, demand for games from platform  $i$  decreases by  $b$  when the price on  $i$  increases, and demand on  $i$  increases by  $d$  when the price on the alternative platform increases.

<sup>664</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 123.

platforms are raised to those seen on the high-fee, PMFN-holding platform. Intuitively, competing platforms would choose to set publisher fees below the level set by Steam to encourage publishers to price lower on their platform to attract users; however, publishers are restricted by Steam’s PMFN. If competing platforms implemented a PMFN as well, that would prevent publishers from charging a lower consumer price on Steam, but because Steam is the high transaction fee option, this is a non-binding constraint on publishers. Consequently, whether the competing lower transaction fee platform (or platforms) employs a PMFN does not impact the consumer price that a publisher chooses on that platform. Thus, in the asymmetric model, the existence of a single PMFN set by the established platform forces all consumer prices to the higher prices set by the high transaction fee platform.<sup>666</sup> This is true so long as demand is “asymmetric enough that the fee-setting equilibrium behaves as if there are two PMFN agreements.”<sup>667</sup> It is clear that demand is asymmetric in the real world because when a PMFN is in place and binding, the consumer prices will be equal across platforms. That is  $p_1^2 = p_2^2$  where the superscript denotes that there are two PMFNs in place (or one binding PMFN). I can subtract the two demand equations above to show that  $x = q_1^2(P) - q_2^2(P)$ .<sup>668</sup> Since Steam sells larger quantities at the same price, this indicates  $x$  is positive.<sup>669</sup>

---

<sup>666</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 123.

<sup>668</sup>  $q_1^2(P) - q_2^2(P) = x + b(p_2^2 - p_1^2) + d(p_2^2 - p_1^2)$   
 $\Rightarrow q_1^2(P) - q_2^2(P) = x$

<sup>669</sup> Note that Steam charging a higher fee than competitors with the PMFN in place also indicates asymmetric demand. While it may seem that firms could simply leave the high fee platform (Steam), Boik and Corts address this concern in their paper. Saying “Our main model also assumes that the seller sells through both platforms, even when it is charged (or can anticipate being charged) a very high fee because of PMFN agreements. It is natural to expect that if PMFN agreements raise fees sufficiently, the seller may wish to drop one platform and sell instead through a single platform, which would render the PMFN agreement moot and therefore potentially reduce fees (though it now pays fees to a monopolist platform, so this is by no means certain). We show in Appendix B that even with PMFN agreements in place, there exist parameter values for which the 2PMFN equilibrium is preferred by the seller over dealing with a monopoly platform, which implies that the seller would in those cases not drop a platform even though it anticipated high 2PMFN fees.” See:

**PMFNs increase fees by decreasing elasticity of demand**

- (255) The asymmetric demand functions allow the derivation of “implied demand as a function of transaction fees[.]”<sup>670</sup> It is referred to as an “implied demand function” because it models quantity demanded as a function of platform fees rather than the consumer price of the good.<sup>671</sup> The platform fees on each platform  $i$  are, as before, denoted as  $f_i$ . The seller’s constant marginal and average production cost is denoted  $c_s$ .<sup>672</sup> How a seller sets their consumer prices, and by extension how a platform’s fees impact demand on its platform, depends on whether a PMFN is in place.<sup>673</sup> Below are the implied demand functions for the established platform (e.g., Steam), denoted as  $q_1^{0,2}(f)$  where 0 and 2 denote whether or not there are PMFNs in place.<sup>674</sup>

$$q_1^0(f) = \frac{1}{2}[a - b(c_s + f_1) + d(c_s + f_2)]$$

$$q_1^2(f) = \frac{1}{4}[2a + 2dc_s + d(f_1 + f_2) - b(2c_s + f_1 + f_2) + x]$$

- (256) These implied demand functions show that removing the PMFN *increases* the responsiveness of the established platform’s quantity sold to platform fee changes. That is, the change (mathematical derivative) in quantity with respect to the established platform’s fee,  $f_1$ , becomes *more negative* without a PMFN, meaning that quantity demanded will decrease *more* with an increase in platform fees. Below, I show the resulting derivatives with respect to the established platform’s fee for each implied demand curve:<sup>675</sup>

<sup>671</sup> This is the relevant demand from the perspective of the platform. The platform sets fees, and those fees determine the quantity of sales on their platform.

<sup>674</sup> As discussed above, whether there are one or two PMFNs the results are equivalent. For clarity, I keep the notation from the Boik and Corts paper and label the outcome with any PMFNs with a 2. See:

Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 133.

(“[I]n essence, implied demand is made more inelastic by the adoption of PMFN agreements since it limits the seller’s incentive to pass through fee increases.”)

$$\frac{\partial q_1^0(f)}{\partial f_1} = -\frac{1}{2}b$$

$$\frac{\partial q_1^2(f)}{\partial f_1} = -\frac{1}{4}(b-d)$$

(257) Using the definition of elasticity of demand (the relationship between a change in price and the resulting change in quantity demanded) and the above equations, I derive the established platform’s elasticity of implied demand with and without a PMFN:<sup>676</sup>

$$\epsilon_1^0(f) = \frac{b f_1^0}{2 q_1^0}$$

$$\epsilon_1^2(f) = \frac{b-d f_1^2}{4 q_1^2}$$

(258) These equations show that a PMFN *reduces* the established platform’s elasticity of implied demand (*i.e.*, demand is more *inelastic* with the PMFN).<sup>677</sup> This can be seen from the following.

$$\epsilon_1^0(f) = \frac{b f_i}{2 q_i} > \frac{b-d f_i}{4 q_i} = \epsilon_1^2(f)$$

$$\Leftrightarrow \frac{b}{b-d} > \frac{2}{4}$$

(259) Per Boik-Corts, since  $b > d > 0$ , the following inequality holds:

$$\frac{b}{b-d} > 1 > \frac{2}{4}$$

Also note that  $b, d > 0$  and  $b > d$ . See:

Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 111.

<sup>677</sup> The elasticity with a PMFN,  $\epsilon_1^2(f)$ , has a larger denominator ( $4 > 2$ ) and a smaller numerator. I know  $b-d < b$  because  $b > d > 0$ . See:

Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 111.

(260) Thereby proving:

$$\epsilon_1^0(f) > \epsilon_1^2(f).$$

(261) As Boik and Corts point out, “[t]he fundamental mechanism at work in raising [platform] fees and [consumer] prices in our model is that PMFN agreements reduce the elasticity of implied demand for a platform when considering its fee[.]”<sup>678</sup> In other words, with a PMFN in place, the high-fee established platform can charge a higher fee and, even if that fee increase leads to higher consumer prices, consumers will not have the option to switch to a platform with a lower consumer price (since it is not allowed by the PMFN). Since the same fee increase will result in fewer consumers leaving the platform (since consumers cannot get lower prices elsewhere), the established platform will implement higher transaction fees with the PMFN in place.<sup>679</sup> Per Boik and Corts, “the basic intuition is that a firm seeking to compete on the basis of low price (typically, a demand-disadvantaged or marginal-cost-advantaged firm) has a hard time competing when the possibility of undercutting the higher-value, or higher-cost incumbent is precluded.”<sup>680</sup>

#### **Steam’s PMFN deters entry**

(262) As a result of inflated platform fees and potentially consumer prices (depending on pass-through), PMFNs in general deter entry of platforms with a “sufficiently large difference in position.”<sup>681</sup> As I showed above, the level of differentiation when a binding PMFN is in place is measured by  $x = q_1^2(P) - q_2^2(P)$ .<sup>682</sup> Steam’s large market share relative to its competitors demonstrates that  $x$  is large in this case.

(263) The impact of a PMFN on a platform’s decision to enter the market depends on the difference between a potential platform entrant’s demand and preferred fee and the incumbent platform’s

 $\Rightarrow q_1^2(P) - q_2^2(P) = x$

demand and fee. A PMFN raises platform fees, so other platforms that want to charge high fees may benefit from the PMFN (as they would benefit from the same lack of competition on fees as would the established platform). However, in the more typical case, if an entrant expects to sell less at the same consumer price (as would be the case here, given Steam’s dominant market position), a PMFN discourages entry.<sup>683</sup> The PMFN prevents potential entrants from competing on the consumer price of games (that is, allowing sellers to list products at a lower price and maintain profit margins by offering sellers lower fees), so these low-fee platform entrants cannot effectively compete with the high-fee (high-cost) incumbent platform.

- (264) In the context of the actual PC game platform market, entrants competing with Steam generally charge lower fees than Steam, even after entering and in the presence of the PMFN.<sup>684</sup> Hence, Steam’s competitors are of the “low-fee” type, and disadvantaged by the PMFN.
- (265) This effect is illustrated in Figure 4 below. The vertical axis is the fixed cost of entering the market, and the horizontal axis is the demand disadvantage faced by the potential entrant platform relative to the incumbent platform (Steam).<sup>685</sup> The two lines show the variable profits for each degree of differentiation  $x$  such that a platform will enter if  $\pi_2^{j*}(x) - k_2(x) \geq 0$  where  $j = 0, 2$  indicates whether PMFN policies are adopted.<sup>686</sup> The negative slope of the profit functions indicate that a potential entrant’s variable profit  $\pi_2^{j*}(x)$  decreases with the platform’s demand disadvantage. The steeper line in the presence of the PMFN reflects that the presence of the PMFN causes the potential entrant’s variable profits to decline more quickly as the demand disadvantage grows.<sup>687</sup>

Figure 4: PMFN Entry Graph<sup>688</sup>

- (266) In the PC game distribution market, competing platforms fall on the right side of the graph in the blue shaded oval (with a large  $x$  value), meaning their profits fall as their demand disadvantage grows. There are three types of platforms in the oval. The first type of platform, characterized by large fixed costs and a large demand disadvantage relative to the established platform, never enters the market. The second type of platform always enters the market, despite the presence of the PMFN, but to limited success (see Section 4.1 and Section 6.2). In Figure 4, the green point illustrates where a platform of this type may fall on the graph. These competing platforms can afford to enter and do so despite the PMFN but would still receive higher profits in the absence of the PMFN since their variable profits are higher without a PMFN, *i.e.*, the  $\pi_2^{0*}(x)$  is above the  $\pi_2^{2*}(x)$  line for this platform at this level of  $x$ .
- (267) The third type of platform would enter absent the PMFN but does not enter in the presence of the PMFN. In Figure 4, the yellow point illustrates where a platform of this type may fall on the graph. These platforms *would* enter and compete with Steam (driving down fees) if the PMFN were not in place but do not enter because of the PMFN.
- (268) Note that while the effect of the PMFN on overall *entry* depends on the entrant platform’s type (where they fall on the graph), the PMFN increases fees across all of the possible scenarios on

<sup>688</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 125.

the graph. This is because a PMFN decreases the established platform’s elasticity of demand which increases the established platform’s prices, as explained above. If there were “similar” platforms on the left-hand side of the graph, the PMFN would only encourage them to enter *because* the PMFN increases platform fees. The fact that in the real world the PMFN reduces overall entry is an additional harm to game publishers beyond the increase in fees and the general conclusion that the PMFN reduces platform variety.

- (269) Other economic literature on PMFNs supports these insights.<sup>689</sup> Jonathan Baker and Fiona Scott Morton explain how entrants to a market typically benefit from a low-price strategy and how that strategy is disrupted by a traditional MFN:<sup>690</sup>

An MFN can raise the costs of current or potential competitors by negotiating lower prices from suppliers of critical inputs. For example, suppose an entrant wishes to gain customers by charging a lower price (perhaps because it has no established brand name or installed base). It can profitably sell at a low price by undertaking selective contracting with suppliers [(here, publishers)] willing to offer a discount in exchange for more volume or other favorable terms. If those suppliers also supply the incumbent [(here, Steam)], however, an MFN imposed by the incumbent would require the supplier to charge the same price to the entrant. This parity undermines the entrant’s business model by preventing it from making an attractive offer to customers. The symmetry that MFNs impose on the marketplace thus can prevent new competition that would lower prices.

- (270) While this narrative treats platform characteristics as fixed, it is likely that platforms have some control over their type. Platforms can choose to add features that could increase demand at a given price, allowing the platform to compete more effectively at a high-fee equilibrium. To the extent that platforms have any control over the nature of their operation (including pricing and fee structure), a PMFN imposed by an entrenched platform will push any entrants into the market to choose a higher-cost, higher-fee version of their platform, minimizing cross-platform differentiation.<sup>691</sup> This results in a reduction in platform variety, impacting both publishers and users negatively. See discussion in Section 6.3.

---

<sup>689</sup> Other work corroborates the harmful impact of PMFNs on competition. Professors Baker and Scott Morton find that “platform MFNs generally harm competition, except in narrow circumstances in which freeriding concerns are especially strong.” See Section 7.5.3 for further discussion regarding freeriding. (271) As I discuss in Section 6.3 a reduction in platform variety in the video game distribution market in turn reduces the variety of PC games. A PMFN pushes platforms towards a high-fee model. This, in turn, will push up retail prices as developers pass through part of the (relatively higher) fee to consumers. Developers, then, will only produce game types that will do well on a high-fee platform model. Games that might be developed for sale on low-fee platforms might not generate enough profits to surpass development costs on high-fee platforms. Such games may systematically differ from high margin games in type of content they offer (for example the genre of the game or amount and quality of content included).

### 7.2.2. Numeric analysis

(272) To further illustrate the impact of Steam’s PMFN on developers, I calibrate the model outlined above to case-specific parameters. The model as presented above uses demand and cost parameters  $a, b, d, x, c_1, c_2, c_s$  to determine prices, fees, and quantities with and without a PMFN on both platforms.<sup>692</sup> I determine a set of model parameters  $a, b, d, x, c_1, c_2, c_s$  that correspond to the case specific values for  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1, c_2$ . Using this set of model parameters, I can then model the corresponding fees, prices, and quantities absent the PMFN; that is, the impact of eliminating the PMFN.<sup>693</sup> My model considers a competing platform to Steam; I illustratively use EGS. I find that without the PMFN, the seller’s economic profits would increase from \$0 to approximately [REDACTED]. My results are below.

(273) I use case-specific parameters to calibrate the model. First, the price of a game in the presence of a PMFN,  $p_1^2, p_2^2$ , is normalized to \$60. Steam’s quantity and EGS’s quantity,  $q_1^2, q_2^2$ , are determined from Steam’s market share of [REDACTED] over the period of 2017–2021 and the total market revenue of [REDACTED] over the period 2017–2021, giving quantities for Steam ( $q_1^2$ ) and EGS ( $q_2^2$ ) of approximately [REDACTED] units and approximately [REDACTED] units, respectively, using a normalized price of \$60 per game.<sup>694</sup> The commission rate for Steam with the PMFN in place,  $f_1^2$ , is set to [REDACTED] (see Section 8.3).<sup>695</sup> I use Epic’s and Microsoft’s 12%

commission rate for  $f_2^2$  (see Section 6.1). I set  $c_1$  to [REDACTED] (see Section 8.3) and  $c_2$  to [REDACTED] of transaction value (see Section 4.2.4).

(274) I use the R package `nloptr`, which solves constrained optimization problems, to find model parameters  $a, b, d, x, c_1, c_2, c_s$  that minimize the sum of the squared difference between the real-world values I outline above, and the corresponding values the model produced by the inputs. For a given set of model inputs, the values for the outputs  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1, c_2$  are determined via a two-step process described in appendix A.1. The constraints from the model are imposed on the solution, that is that  $b > d$  and  $c_1 > c_2$ , along with constraints that quantities, fees, and platform profits with and without the PMFN all must be positive.<sup>696</sup> The full analysis is available in available in the provided R code.<sup>697</sup> The result of this process is shown in Table 3 below, along with Figure 5. Some of the figures below may not match the case-specific parameters exactly as a result of the model calibration.

---

<sup>696</sup> These constraints ensure both platforms want to be in the market with the PMFN in place which ensures the example matches reality.

**Figure 5: Transaction Fee and Quantity Shifts**

- (275) Absent the PMFN, many users switch from Steam to EGS, with Steam’s unit share changing from [REDACTED]. Ultimately, total quantity sold increases, Steam’s profits decrease, and EGS’s profits increase. Profits for developers increase, as they are paying a lower weighted commission rate (weighted by units sold across platforms) and selling more units. Consumers are paying a lower total weighted price per game.
- (276) One might notice that prices on Steam increase absent the PMFN. While in the presence of the PMFN, developers were required to set constant prices between Steam and EGS, without the PMFN they are free to set separate prices between platforms, and this is what happens: prices absent the PMFN on Steam and EGS shift to \$61.05 and \$58.37, respectively. Developers increase the relative price on Steam to maximize profits across the two platforms; a relative price decrease on EGS will push users to EGS, allowing developers to earn greater profits through paying reduced fees per game. However, this still results in users paying less per game overall and buying more units overall.
- (277) I note that comparing per-unit prices to consumers, fees to developers, or developer profits within a platform from the PMFN scenario to the non-PMFN scenario is an incomplete

analysis. Developers optimize total profits in each scenario. Doing so requires a consideration of how consumers behave in the presence of pricing across the two platforms; indeed, my model includes a term relating demand on one platform to pricing on the other platform.<sup>698</sup> So while fees paid on each unit on EGS may increase, developers pay a lower weighted commission rate across all games and generate significantly more profits overall, from \$0 in the PMFN scenario to [REDACTED] in the non-PMFN scenario.

- (278) I also note that the sellers’ economic profits on Steam are negative when the PMFN is in place (but seller profits across both platforms are zero). In a monopolistic setting, the monopoly sets price and quantity to capture surplus of its customers (relative to a competitive setting).<sup>699</sup> However, Steam’s fee on its platform is constrained by the economic profits of sellers. Sellers optimize profits across both platforms; these profits are dependent on Steam’s fee. If Steam sets its fee too high, causing the seller’s total economic profits across both platforms to be negative, the seller would exit the market. Therefore, Steam’s fee cannot rise above the level where the seller’s total economic profits are zero. See Appendix A.1.
- (279) Lastly, I note that non-PMFN scenario is a transitional state in which platforms, sellers, and consumers are transitioning from a world with a Valve PMFN in place to a world without a Valve PMFN in place. There are only two platforms in this market; however, both are earning economic profits, indicating that in the long run, there would be additional entrants, which would likely cause fees to decrease even more.<sup>700</sup> As discussed above, the PMFN policy has deterred entry of competing platforms. In a but-for world, more platforms would enter and there would be additional price competition putting downward pressure on Steam’s fees and likely further reducing the quantity sold on Steam at Steam’s higher price level. In these calibrated results, both Steam has more market power absent the PMFN than they would in a true but-for scenario where Steam had not benefited from anticompetitive conduct and more platforms competed in the market. This contrasts with my analysis in Section 8, in which I analyze a but-for world not in the short run after the PMFN is eliminated, but in the long run after the PMFN is eliminated. The period between the two would allow additional platforms to enter the market and prices and quantities to adjust to those entrances.

---

<sup>698</sup> In particular, demand for games from platform  $i$  decreases by  $b$  when the price on  $i$  increases, and demand on  $i$  increases by  $d$  when the price on the alternative platform increases.

<sup>700</sup> Varian, Hal R. (2014), *Intermediate Microeconomics: A Modern Approach*, 9th ed., New York: W.W. Norton & Company, at 434. (“Similarly, if a firm is making profits we would expect entry to occur.”)

(280) By calibrating the model on the current market conditions, the parameters and results reflect Steam’s advantage gained through years of Valve’s anticompetitive conduct via its PMFN Policy. Over time, or in the but-for world where this conduct had not taken place, Steam’s advantageous position gained through the wrongful conduct would decrease and the competition it faced from the competing platforms would be even more vigorous. Also, this model shows a near-term response to the removal of the PMFN Policy based on the real world (*i.e.*, one influenced by Steam’s anticompetitive conduct), rather than the end-state market in the but-for world in which the PMFN Policy never existed. Thus, these estimates do not fully model the end-state impact of the absence of the PMFN Policy on all parameter values in the but-for market. To model the competitive equilibrium reached after Valve’s PMFN is removed—an equilibrium reached before the start of the class period—I use the LandesPosner model, as discussed in Section 8.

(281) As shown above, when I apply my Platform Competition Model to the facts and circumstances of the relevant market, it shows all class members are better off in the but-for world without the PMFN. The commission rates publishers pay on Steam alone, and collectively across Steam and EGS (or another platform), decrease in the but-for world, generating higher market-wide seller profits in the but-for world (at increased quantity). This is compelling economic evidence that Valve’s PMFN Policy is harming all or virtually all members of the class.

### 7.3. Yardstick approach

(282) A yardstick approach is a standard economic method for comparing one business/market to another business/market that is similar in important respects, often as a tool for understanding how a business may have performed “but for” certain actions or events.<sup>701</sup> This approach assumes that in the but-for world, the “business would have performed as the one to which it is being compared, thereby providing a measure (or yardstick)” of the injury.<sup>702</sup> To implement a yardstick approach, a comparison is made between a focal firm and “a different

firm from itself, or of a different market from its market, or both.”<sup>703</sup> A yardstick approach may also entail creating an index of similar firms and comparing the performance of the company at-issue with the performance of the index.<sup>704</sup> Importantly, “[d]epending on the allegations and the evidence, courts sometimes seek adjustments for comparability based on the number of customers, purchase volume, product characteristics, competition, role of technology, capitalization, barriers to entry, and established history.”<sup>705</sup>

- (283) In an antitrust analysis, a yardstick approach is one way to understand how a market would have been structured and/or the prices that would have been charged but for the alleged anticompetitive conduct. For example, a yardstick approach may be used to estimate the but-for pricing structure.<sup>706</sup> As one method of determining what Steam’s take-rate would be in the but-for world, I use a yardstick approach to compare Valve’s commission rate on Steam to platforms in other comparable marketplaces.

### 7.3.1. Identification of benchmarks

- (284) The potential benchmark marketplaces I consider are primarily two-sided digital platforms.<sup>707</sup> I consider a variety of criteria, including but not limited to industry timing, *i.e.*, when firms first entered the marketplace, platform structure, geography, monetization structure, product characteristics, and other platform characteristics, such as potential network effects. Below, I discuss benchmark marketplaces that I deem comparable according to these measures.<sup>708</sup>

In a typical yardstick approach, one compares prices during the period in which the antitrust violation is believed to have had an effect (the “impact period”) to prices in other markets that are deemed to be reasonably comparable to the market at issue.”)

<sup>707</sup> Here, I am not using market in the formal, antitrust sense, as I have not done a market definition analysis in any of these benchmark industries.

<sup>708</sup> Note that I also considered digital ride sharing platforms and mobile app stores. These two markets fail to meet a variety of the comparability criteria. For example, for ride sharing the platform facilitates transportation-as-a-service rather than digital transactions as its market product; operates under a different pricing model—utilizing a wholesale pricing model

(285) Valve’s experts may point to Apple or Google’s app stores as benchmarks, given that they charge similar commission rates as Steam. But Valve may have been the reason these app

rather than an agency pricing model; and does not operate globally in the way that third-party digital PC game distribution platforms can. See:

Transportation-as-a-service: Lyft, Form 10-K, 2022, at 56. (“We earn service fees and commissions from the drivers either as the difference between an amount paid by a rider based on an upfront quoted fare and the amount earned by a driver based on actual time and distance for the trip or as a fixed percentage of the fare charged to the rider.”)

Wholesale pricing: Uber Website, Pricing, <https://www.uber.com/us/en/ride/how-it-works/upfront-pricing/> (accessed 12/20/2023). (“Many data points go into calculating an upfront price, including the estimated trip time and distance from origin to destination, as well as demand patterns for that route at that time. It also includes any applicable tolls, taxes, surcharges, and fees (with the exception of wait time fees).”)

Global operations: Uber, Form 10-K, 2022, at 120.

In the mobile app stores marketplace, key companies (e.g., Apple, Google) are facing significant anticompetitive scrutiny, and as such, is not a reliable measure of a but-for commission rate in a competitive market. See:

Apple App Store: *Epic Games, Inc. v. Apple Inc.*, 559 F. Supp. 3d 898, (N.D. Cal. 2021). (“Plaintiff Epic Games, Inc. sued Apple, Inc. alleging violations of federal and state antitrust laws and California’s unfair competition law based upon Apple’s operation of its App Store.”)

Note that iOS and Android do not compete with each other at the app store level. According to the U.S. House of Representatives Subcommittee on Antitrust, Commercial and Administrative Law, “[t]he App Store and the Play Store do not compete against one another. Android users cannot access the Apple App Store, and iOS users cannot access the Google Play Store, so the dominance of the Play Store is not constrained by the App Store and vice versa.” Instead, each operates in its own ecosystem. See:

U.S. House of Representatives Subcommittee on Antitrust, Commercial and Administrative Law of the Committee on the Judiciary, “Investigation of Competition in Digital Markets: Majority Staff Report and Recommendations,” 2020, at 95, available at: [https://judiciary.house.gov/uploadedfiles/competition\\_in\\_digital\\_markets.pdf?utm\\_campaign=4493-519](https://judiciary.house.gov/uploadedfiles/competition_in_digital_markets.pdf?utm_campaign=4493-519).

In the iOS ecosystem, the Apple App Store is the only store available. See:

Screen Rant, “Apple Says iOS Users are Not Limited to The App Store, But is That True,” 3/26/2021, <https://screenrant.com/apple-ios-app-store-alternatives-iphone-user-dev-restrictions/>. (“In short, iOS app competition is limited by the Apple App Store. It’s the only application storefront that iPhones can use without being jailbroken, developers can’t publish iOS apps through any other medium, and there’s no way for developers to go around the App Store by offering their application directly.”)

In the Android ecosystem, the Google Play Store has a significant share of the market. See:

Business of Apps Website, App Store Data (2022), <https://www.businessofapps.com/data/app-stores/> (accessed 9/16/2022). (“Outside of China, Apple and Google control more than 95 percent of the app store market share through iOS and Android, respectively.”)

stores launched with a 30% commission rate.<sup>709</sup> Apple’s and Google’s app store practices are also subject to antitrust challenges.<sup>710</sup>

### Online retail marketplaces

- (286) A potentially comparable benchmark is the broad universe of online retail (“e-commerce”) marketplaces. This marketplace includes online retailers across various subdivisions, with some selling all types of products and others playing a role in only niche product categories.
- (287) With a similar timeline to that of the PC game distribution market, general e-commerce marketplaces saw increasing popularity in the mid-1990s and 2000s.<sup>711</sup> For example, Amazon became a public company in 1997 and did not become profitable until 2003.<sup>712</sup> In 2000, only 22% of Americans had made purchases online, and this rose to 79% by 2015.<sup>713</sup>
- (288) This marketplace mirrors the third-party digital PC game distribution via platforms market across several different characteristics. Retail e-commerce marketplaces are two-sided digital platforms, with sellers of goods on one side, buyers on the other, and transactions between the two sides facilitated through the platform. Though Amazon is a significant player in the marketplace, it faces competition from other online retail stores, such as e-commerce sites for Walmart, eBay, and Etsy, among others.<sup>714</sup>

- (289) The online retail industry generally operates globally.<sup>715</sup> As with the market for third-party digital PC game distribution via platforms, these platforms also operate under an agency pricing model, whereby sellers will set the retail price and the platform will set commissions or take rates on each sale.<sup>716</sup> Platforms in this marketplace typically receive revenue by taking a percentage of each transaction plus, in many instances, a small, fixed fee per transaction.<sup>717</sup> While fees often vary depending on both the platform and the product, they typically fall within the 8% to 15% range.<sup>718</sup>
- (290) Thus, the e-commerce retail marketplace operates with similar product characteristics, platform characteristics, geographic scope, and monetization structure as the third-party digital PC game distribution via platforms market.
- (291) I am aware that Amazon has been sued by the FTC alleging violations of the antitrust laws for behaviors that are at least partially analogous to the PMFN conduct challenged here.<sup>719</sup> I take no position on whether the allegations against Amazon are supported by the facts or whether Amazon has violated the antitrust laws, as alleged by the FTC. To the extent the commission

rate in this benchmark marketplace reflects anticompetitive conduct, it is a conservative benchmark for purposes of this case.

### **Online vacation home rental**

- (292) Another potential comparable marketplace is for online vacation home rentals. This consists of two-sided digital platforms with property owners and guests on either side of the marketplace transacting with one another as facilitated by the platform. Companies that operate in this marketplace include Airbnb and VRBO, among others.
- (293) The marketplace timing and growth for online vacation home rentals accommodations in the late 1990s and 2000s also make the industry a suitable comparison to the relevant marketplace in this case.<sup>720</sup> The vacation home rental marketplace VRBO started in 1995, eventually followed by HomeAway and Airbnb’s launches in 2005 and 2008, respectively.<sup>721</sup>
- (294) While a vacation rental home is a physical good/service and a digital PC game is a digital good, the similarities between the marketplace characteristics outweigh that difference. Platforms in the vacation rental home booking marketplace monetize by taking a service fee from hosts, the guests, or a combination of the two.
- (295) For example, Airbnb takes a 3% service fee from the property host and adds on a 14% service fee to guests.<sup>722</sup> This differs slightly from the payment model present in the market for third-party digital PC game distribution via platforms, where the platform only takes a service fee one side of the market, yet still represents a monetization structure whereby the platform operates as a distribution agent and does not set the price, instead collecting a fee from platform transactors.

**7.3.2. But-for take rate**

(296) Based on the above discussion, I conclude that the reasonably comparable benchmarks for the market for third-party digital PC game distribution via platforms are e-commerce marketplaces and vacation home rental marketplaces.<sup>723</sup> By analyzing the take rates in these marketplaces, I am able to draw reasonable inferences about the commission structure on the Steam platform. Below, I have shown the take-rates of competitors in these marketplaces.

**Table 4: Take Rates in Benchmark Markets<sup>724</sup>**

Market	Competitor	Take rate	Additional fees	Notes
E-commerce marketplaces	eBay	3-15%	+ \$0.30 per transaction	
E-commerce marketplaces	Amazon	8-20%	+ \$0.99 per item or \$39.99 per month	
E-commerce marketplaces	Walmart	6-20%		
E-commerce marketplaces	Etsy	6.5%	3% + \$0.25 payment processing fee; \$0.20 listing fee	
Vacation home marketplaces	Airbnb	17%		3% to host, 14% to guests
Vacation home rental marketplaces	VRBO	11-20%	3% payment processing fee	5% to host, 6- 15% to guests

<sup>723</sup> I do not opine to whether or not there are anticompetitive implications in these comparable marketplaces. Should there be anticompetitive concerns in any of these comparable marketplaces, utilizing the take rates would represent an upper-bound on a competitive but-for commission.

<sup>724</sup> Etsy takes 9.5% + \$0.45 per sale. Sellers pay a \$0.20 listing fee, a 6.5% transaction fee, a 3% payment processing fee, and an added \$0.25 payment processing fee per sale. See:

Etsy Website, Sell, [Etsy.com/sell](https://www.etsy.com/sell) (accessed 10/30/2023).

eBay takes anywhere from 3–15%, with an additional \$0.30 per sale. For most product categories, if the sale is upwards of \$7,500, the listed percentage applies to the portion of the sale up to \$7,500 and there is an additional 2.35–3% for the portion of the sale above \$7,500. See:

eBay Website, Selling Fees, <https://www.ebay.com/help/selling/fees-credits-invoices/selling-fees?id=4822> (accessed 1/31/2024).

Amazon takes 8–20% + \$0.99 per item sold or \$39.99 per month. Amazon takes 45% for Amazon device accessories. See:

Amazon Website, Pricing, <https://sell.amazon.com/pricing> (accessed 9/25/2023).

- (297) As discussed above, some of the major industry participants in the online retail marketplace include eBay, Amazon, Etsy, and Walmart. These firms monetize their platforms by charging a percentage fee of anywhere between 3% and 20% from the seller side and charge nothing directly to the buyer side.
- (298) The majority of take rates for Etsy, eBay, Amazon, and Walmart fall between 8% and 15%, with select product categories such as jewelry, fine art, and gift cards at 20% on various sites.<sup>725</sup> On eBay, Amazon, and Walmart, the rate structure is tiered, where the percentages decrease for higher priced goods (for example, 15% for the first portion of the sale up to a specific value and then a lower percentage, such as 2.35%, for the remainder of the purchase price over a certain number).<sup>726</sup> This means the effective take rate is actually lower than the rate listed.
- (299) In the vacation home rental marketplace, the two principal market participants for vacation home rentals, VRBO and Airbnb, operate under a slightly different business model where they charge both sides of the market, however, both take approximately 17–20% from both sides of the platform collectively.<sup>727</sup>

---

Walmart takes 6–20%. Walmart takes 6% for personal computers. See:

Walmart Website, Referral Fees, <https://marketplace.walmart.com/referral-fees/> (accessed 1/31/2024).

Similarly, VRBO charges a 5% commission fee with a 6–15% service fee for guests, totaling 11%–20%. See:

Walmart Website, Referral Fees, <https://marketplace.walmart.com/referral-fees/> (accessed 1/31/2024).

<sup>727</sup> Airbnb takes a 3% service fee from the property owner and adds on a 14% service fee to guests, for a total of 17%. See: Airbnb, “How much does Airbnb charge Hosts?” 3/14/2023, <https://www.airbnb.com/resources/hosting-homes/a/how-much-does-airbnb-charge-hosts-288>.

Similarly, VRBO charges a 5% commission fee with a 6–15% service fee for guests, totaling 11%–20%. See:

Upgraded Points, “VRBO vs. Airbnb for Guests & Hosts [Comparing Fees, Listings, Cancellation Policies],” 8/22/2023, <https://upgradedpoints.com/travel/vrbo-vs-airbnb-for-guests-and-hosts/>.

- (300) As the above take rates in the retail e-commerce and vacation home rental marketplaces also generally fall within the 15% to 20% range, this range of rates suggests that platforms in these marketplaces compete in part through pricing. As such, a but-for take rate in the relevant market would likely conservatively fall somewhere between 15% and 20%.
- (301) Because a yardstick approach indicates that the market but-for commission rate would be between 15% and 20%—below Valve’s 30% commission rate and effective rates from its tiered commission system—all or virtually all putative class members were impacted by the supracompetitive fees charged by Valve.

## 7.4. Empirical approach

- (302) I also deploy an empirical approach, which looks to the actual-world facts and circumstances to see if any economic insights can be gleaned from Valve’s reactions and responses to real-world events. When possible, economists often turn to “natural experiments” to assess what would happen in the absence of certain conduct.<sup>728</sup> One way a natural experiment can occur is when one observes two different time periods, one with specific conduct and one without.<sup>729</sup> By examining the difference between the two time periods, all else equal, one can infer the

(“A natural experiment is an empirical or observational study in which the control and experimental variables of interest are not artificially manipulated by researchers but instead are allowed to be influenced by nature or factors outside of the researchers’ control. Unlike traditional randomized experiments, natural experiments are not controlled by researchers but rather observed and analyzed.”; “In the social sciences, particularly economics, the expensive nature and limitations of traditionally controlled experiments involving human subjects has long been recognized as a limitation for the development and progress of the field. As such, natural experiments provide a rare testing ground for economists and their colleagues. Natural experiments are used when such controlled experimentation would be too difficult, expensive, or unethical as is the case with many human experiments.”)

(“One way of establishing causality is to use randomised experiments, where researchers allocate individuals to treatment groups by a random draw. This method is used to investigate the efficacy of new medicines, among other things, but is not suitable for investigating many societal issues – for example, we cannot have a randomised experiment determining who gets to attend upper-secondary school and who does not. Despite these challenges, the Laureates have demonstrated that many of society’s big questions can be answered. Their solution is to use natural experiments – situations arising in real life that resemble randomised experiments. These natural experiments may be due to natural random variations, institutional rules or policy changes.”)

(“David Card began to analyze a number of core questions in labor economics using ‘natural experiments’, i.e., a study design in which the units of analysis are exposed to as good as random variation caused by nature, institutions, or policy changes.”)

causal effect of the conduct.<sup>730</sup> Valve’s PMFN Policy has been in place for many years. Thus, there is no pre- and post-PMFN time period that could lead to a reasonable natural experiment. Nonetheless, some platforms did enter the marketplace during the class period, *e.g.*, EA, Ubisoft, Epic, and others.<sup>731</sup> While meaningfully effective entry was rendered impossible by Valve’s conduct (see Section 6.2), studying the economic effects of these entry attempts sheds some light into what a but-for world free of Valve’s anticompetitive parity enforcement may look like.

When such groups are present, the processes behind natural experiments are said to resemble randomization even when researchers do not interfere. Under these conditions, observed outcomes of natural experiments can feasibly be credited to the exposure meaning that there is some cause for belief in a causal relationship as opposed to simple correlation. It is this characteristic of natural experiments — the effective comparison that makes a case for the existence of a causal relationship — that distinguishes natural experiments from purely non-experimental observational studies.”)

(“It would be easy to believe that situations which enable natural experiments are very unusual, especially those that can be used to answer important questions. Research conducted over the past 30 years has shown that this is not the case: natural experiments occur frequently. For example, they may arise due to policy changes in some regions of a country, admission cut-offs in higher education, or income thresholds in tax and benefit systems, which mean that some individuals are exposed to an intervention while other, similar, individuals are not. There is thus unintended randomness that divides people into control and treatment groups, providing researchers with opportunities for uncovering causal relationships.”)

than entering the market as a price-taker, Epic’s strategy was, and remains, to try to attract developers and publishers to EGS by offering a lower commission rate and initial free use of Epic’s gaming engine.<sup>735</sup> Specifically, Epic charges developers and publishers a commission rate of 12%, compared to Valve’s 30%.<sup>736</sup> Epic also offers developers free use of Epic’s Unreal Engine until the gross revenue of the product exceeds \$1 million.<sup>737</sup> When a product exceeds \$1 million in gross revenue, Epic charges developers a 5% royalty for use of its engine.<sup>738</sup> Deposition testimony from Mr. Lynch indicates that Epic’s revenue share “was a selling point for some developers” and “was one of the things that piqued their interest.”<sup>739</sup>

- (304) Because of the Valve PMFN, Epic was also forced to use non-price inducements to attempt to compete against Steam. One strategy was to implement exclusive deals with developers, cutting out Steam and its users for the initial release of a game. These exclusive offerings include high-profile games such as *Metro Exodus*, *The Division 2*, *Red Dead Redemption 2*, and *Borderlands 3* and smaller indie-developed games such as *Ooblets*, *No Straight Roads*,

move by Valve to improve Steam economics for all developers would make a great difference[.]” hinting at Valve’s revenue share.<sup>753</sup>

- (307) On November 30, 2018, shortly before the launch of EGS, but after learning that EGS was coming on market with a commission rate lower than 30%,<sup>754</sup> Valve announced “new revenue share tiers for games that hit certain revenue levels.”<sup>755</sup> Instead of taking 30% of all revenue for a given game, Valve announced it would take 30% of lifetime revenues up to \$10 million, 25% of lifetime revenues between \$10 million and \$50 million, and 20% of all lifetime revenues over \$50 million.<sup>756</sup> See discussion in Section 3.3.4.
- (308) Concern over Epic’s entry and threat of potential competition in the third-party digital PC game distribution via platforms market directly led to Valve’s tiered commission rate change. Steam’s tiered commission structure represents a limited response to the competitive challenge it perceived in 2018, limiting the benefits to a relatively small number of publishers while changing nothing for the vast majority of publishers. Valve responded to the perceived competition without altering its rate structure for the overwhelming proportion of publishers. More importantly, the tiered structure introduced kept commission rates at supracompetitive, albeit somewhat lower, levels. In fact, Steam’s effective commission rate across all developers from November 30, 2018 through December 31, 2022 was still [REDACTED] according to Valve’s transaction data, still above any potential but-for commission rate, as determined in Section 7.3 or from the more formal but-for rate analysis outlined below.<sup>757</sup>

The effective rate for all calculated commission rates associated with positive revenue over this time is modestly higher, at [REDACTED].

- (309) In the but-for world, where there was no PMFN, Steam would have likely faced a more expansive competitive threat and likely much earlier than Epic’s entrance. Steam would have faced multiple credible competitors, who would have sought to attract the largest games to their platforms to attract users and build network effects, as Steam did. Once those competitors had succeeded in building network effects, they would then become more attractive options for publishers of smaller games and those smaller games would in turn be more attractive to competitors. In such a competitive context, Steam would likely face pressures to both (1) further lower its commission rate for the largest games that entered Steam’s tiered commission structure and (2) lower its commission rates for smaller games that did not enter Steam’s tiered commission structure.<sup>758</sup>
- (310) As I discussed above, despite both Valve’s initial reaction to Epic’s entry and Epic’s strategies to compete with Steam, EGS has been largely unsuccessful as a direct result of Valve’s monopoly power and the PMFN Policy. See discussion in Section 6.2. In the framing of Boik and Corts, because Epic entered as a low-cost alternative, its strategy of competing on price is thwarted by Steam’s monopoly power and PMFN policy; consumer price *has* to be equal, and thus, users want to be on Steam where there are better features, more users, more developers, and more games. Because of Valve’s expansive base of users, developers, and publishers, Epic has had to focus on growth as opposed to profitability,<sup>759</sup> all the while accomplishing neither to a meaningful degree. As discussed in Section 6.2, Epic has been unprofitable and has failed to command a meaningful share of the relevant market. Additionally, many publishers who left Steam and signed exclusive deals with Epic have done so because of Epic’s advances and money guarantees that were sometimes [REDACTED] [REDACTED].<sup>760</sup> However, these movers were quintessential “hit and run” shifts; many of these publishers have since returned back to Steam after the expiration of their exclusive deals with Epic. - (311) While Epic has failed to meaningfully compete with Steam, its 12% commission rate represents a realistic floor on a competitive but-for commission rate that is both sustainable and profitable. As discussed above, Epic’s inability to compete is not as a result of its commission rate. In fact, Epic has indicated publicly that the 12% commission rate is profitable and sustainable.<sup>761</sup> Epic’s court documents reveal that Epic determined the 12% rate to be “competitive, sufficient to cover its costs of distribution and allow for further innovation and investment in EGS.”<sup>762</sup> Additionally, according to an internal Epic email, Epic determined that even dropping the percentage split that Epic takes on each sale to 10% would have still allowed the company to be operate that portion of the business profitably.<sup>763</sup> In a Q&A discussion in December 2018, Tim Sweeney stated that “[i]n [Epic’s] analysis, stores charging 30% are marking up their costs by 300% to 400%. But with developers receiving 88% of revenue and Epic receiving 12%, this store will be a profitable business for us.”<sup>764</sup>
- (312) Additional evidence indicates a 12% (or lower) take-rate would be sustainable for other platforms. In response to the launch of the EGS, Discord announced that it would only charge a 10% commission rate, allowing developers to keep 90% of revenue from their games.<sup>765</sup> Discord’s CEO stated that “it does not cost 30 percent to distribute games in 2018,” and that “[a]fter doing some research, we discovered that we can build amazing developer tools, run them, and give developers the majority of the revenue share.”<sup>766</sup> Discord’s response to the

commission rates announced by Epic reflects the behavior of a third-party digital PC game distribution platform lowering prices in response to increased competitive pressure. Microsoft similarly announced a lower commission rate following Epic’s entry. In an April 2021 post on Xbox Wire, Microsoft stated that “the developer share of Microsoft Store PC games sales net revenue will increase to 88%, from 70%. A clear, no-strings-attached revenue share means developers can bring more games to more players and find greater commercial success from doing so.”<sup>767</sup> Similarly to EGS, Discord and Microsoft’s lack of success came as a result of Steam’s monopoly power and PMFN policy, as opposed to the commission rate they charged. See discussion in Section 6.2.

- (313) Thus, in the but-for world, Steam’s advertised commission rate would be lower than the lowest tier rate of 20% that Steam adopted for high-revenue games. The Platform Competition Model approach, yardstick approach, and empirical approach conducted above suggest a but-for take rate of between 12% and 20%. Epic’s 12% commission rate represents an effective floor that would still allow for Steam and other platforms to operate profitably, while the platform competition model approach and yardstick approach suggest a commission rate between 15% and 20%. Together, all three approaches provide complementary and consistent evidence that all or virtually all members of the class were injured by Valve’s conduct.

## 7.5. Assessment of potential counterarguments

### 7.5.2. Selective enforcement of PMFN impacts all publishers

- (320) Valve may argue that it has only sporadically enforced the PMFN, only against certain publishers and in certain discrete situations. However, as an economic matter, this argument misses the mark. Valve’s PMFN Policy enforcement has reduced *platform* competition. By blocking the emergence of viable alternative platforms, *all* publishers were denied the opportunity to utilize those alternative platforms—not only those who faced direct enforcement. This view misses the practical impact of even selective enforcement as a signaling device and as presenting a credible threat to any publisher considering violating the PMFN policy in order to charge consumers lower prices.
- (321) PMFN Policy enforcement against high-revenue publishers limits the ability of rival platforms to compete effectively with Steam. Valve may prioritize efforts among its highest drivers of revenue, which, consequently, have the most visibility in the relevant market. As discussed above in 5.2, large publishers such as [REDACTED], and others experienced Valve’s PMFN enforcement, and thus put on first-hand notice of Valve’s PMFN Policy. Even if only these large publishers were directly impacted by Valve’s PMFN Policy, that would take a major portion of the available commerce off the market for alternative platforms, depriving those alternative platforms of the volume they would need to succeed against Valve. Moreover, when Steam enforces the PMFN against some of its largest publishers, it sends a strong signal to all publishers of its willingness to take significant steps to enforce the policy. Put differently, if publishers such as [REDACTED] and others are vulnerable to punishment for violating the PMFN, no publisher is safe.
- (322) Clearly, publishers knew of Valve’s parity rules and abided by them.<sup>775</sup> Speculation around cross-platform PMFN enforcement occurs in industry news outlets.<sup>776</sup> Beyond publicly

Valve seems more determined to crack down on low-cost Steam key hawkers: there’s new language here: ‘If you request an extreme number of keys and you are not offering Steam customers a comparable deal, or if your sole business is selling Steam Keys and not offering value to Steam customers, your request may be denied and you may lose the privilege to request keys.’ (Some small companies have been buying out old games with achievements/cards, just to sell their keys in bulk, right?)”)

- (323) Valve has also told individual publishers that Steam will often choose to stop selling content where price parity is not met on other platforms.<sup>784</sup> For publishers that need access to Steam’s user base, these indirect threats create pressure to comply and the enforcement actions make those threats credible. Thus, whether Valve intends to enforce pricing parity against an individual publisher, the threat of that enforcement is enough to influence publisher behavior and yield compliance.

Or maybe I just got a response from the pro-denying-keys faction, who knows. The total refusal of giving extra visibility for a discount is. . . dense, though, and suggests they don’t especially care about the developer in question or why they do bundles in the first place. Maybe a bigger fish can leverage them harder there, no idea. [Valve’s response was:] “Sure, happy to explain our thinking around keys! There really hasn’t been a sea change in relation to keys, we just ask that all of our partners treat Steam customers fairly and give them the same deal that you’re offering bundle customers. . . . This is something we apply equally to all partners big and small, and it isn’t tied to visibility or placement on the store so we don’t offer guaranteed featuring or anything like that. The prevalence of MFN contract terms on online platforms and the steadily growing share of GDP spent on such platforms suggest that greater antitrust enforcement against anticompetitive platform MFNs could have noticeable benefits for productivity and consumer welfare.”)

sellers.<sup>786</sup> For example, consider an online travel agency like Booking.com that has invested in building a platform that allows travelers to compare hotels and then book at the one that best suits their needs. If individual hotels could offer lower prices on their own websites, travelers could use Booking.com to find the best match and then book at the lowest rate on the hotel’s website. This type of freeriding by the hotel (or “showrooming” by the platform) would reduce the incentive for the platform to invest in the valuable service of matching travelers to hotels.<sup>787</sup> That could potentially provide a pro-competitive justification for a parity clause, at least on a temporary basis until the platform were able to recoup its initial investment.

- (325) The argument does not fit the facts here. Steam was able to recoup the costs of implementing any valuable fixed investment costs (such as a search mechanism) [REDACTED]. While Steam’s reported after-tax net profit was negative in each year from [REDACTED], lifetime after-tax net profits turned positive [REDACTED], finishing the year with [REDACTED] in lifetime after-tax net profits.<sup>788</sup> Thus Steam was able to recoup its initial investments by [REDACTED] at the latest, and the investment justification would not apply as an empirical matter after [REDACTED].

Showrooming, which is a form of free-riding, may therefore undermine a platform’s ability to operate. A PPC (either narrow or wide) eliminates the restriction on the platform’s fee implied by such showrooming.”)

<sup>788</sup> See Attachment D-1.

- (326) Further, while the potential for procompetitive effects exists theoretically, at least when a platform first launches, academic literature suggests that the harmful effects of PMFNs are more significant than the potential procompetitive effects. Wang and Wright (2020) find that “despite allowing for showrooming in [their] model, . . . price parity clauses often harm consumers.”<sup>789</sup> Baker and Scott Morton (2018) similarly conclude that “platform MFNs generally harm competition, except in narrow circumstances in which freeriding concerns are especially strong.”<sup>790</sup>
- (327) The availability of other PC game platforms and discrepancies in the size of game libraries make it unlikely that users would choose to switch between platforms to search and then purchase a game. As discussed in Section 4.1.2, many competing platforms were established years after Steam. Therefore, for many years since Steam’s launch, users would not have a viable alternative platform to purchase a game on after finding it on Steam. Steam also offers many more games compared to competing platforms. For example, as discussed in Section 6.2, EGS offered 1,548 games in 2022, compared to Steam offering approximately 90,000 games as of early 2024. As another example, in 2020, GOG had over 4,700 products, compared to Steam’s 43,798 games.<sup>791</sup> This discrepancy means that for tens of thousands of games, users could not purchase a game found on Steam on another platform and there is no free-riding risk.
- (328) Users may not have the same incentive, described above, of only using Steam for its searching functionality. While users can search for games on Steam, Steam provides *other* features and functionalities that at least some users find valuable.<sup>792</sup> Steam’s primary service is to provide

- (329) Due to the reasons described above, the potential procompetitive effects of Valve’s PMFN are relatively small (if they exist at all) compared to the anticompetitive effects as described in Section 5.1.

#### 7.5.4. Consumer regret

- (330) Valve may justify its PMFN Policy by claiming that users may experience regret when they purchase a game on Steam and then see the game offered for a lower price on another platform.<sup>794</sup> Valve considers consumer regret to be detrimental to a user’s experience on Steam, and as such, uses it as a justification to enforce its PMFN Policy.<sup>795</sup> For example, Valve employee Kassidy Gerber, informs ██████████ in an email that Valve will be delisting

Are we talking about this specific example? Q. Sure. A. Okay, in this specific example, we’re having a conversation with a partner because we believe they’re offering the product for a better price elsewhere. Q. And that’s a problem? A. A. No. Q. Not at all? A. No, we’d be perfectly happy if the -- in a situation like we’ve discussed, if the partner said, okay, well we will lower the price on Steam to match the price as it is elsewhere. That lower price would result in less revenue share for us. Q. Well, you actually participated yourself in one of the documents I looked at in literally removing a Triple-A title from the Steam store because it was priced lower elsewhere? A. Uh-huh. Q. That is completely eliminating any revenue that Valve could derive from sales of that title? A. That’s true. Q. So Valve was completely willing to just forsake all that revenue because that title was being sold for lower elsewhere? A. It’s important to us that customers have a good experience on Steam.”)

Jason Ruymen, Dep. Tr., 9/19/2023, at 35:13–17. (“Q. And customers are disadvantaged on Steam if the price on Steam is higher than the price at another – another retailer; is that right? A. One of the things we try not to do on Steam is have a customer regret their purchase.”)

one of its games due to price discrepancies between Steam and other platforms.<sup>796</sup> When describing Valve’s decision, she states: “Ultimately [REDACTED] retail strategy is yours to control in whatever way you see fit. However, it is our job as stewards of the platform is [sic] to protect Steam customers and to ensure that they are being treated fairly. We will not knowingly invite customer regret by offering your game at a premium to other retailers.”<sup>797</sup> As another example, when reaching out to a developer regarding price parity, a Valve employee states: “[P]art of running our store and our sales is treating Steam customers well. We’re not really interested in running a store where customers regret their purchases or wish they bought somewhere else. Our general attitude historically has been that if Steam customers don’t get a fair shake from a publisher or developer, we just opt not to sell the game in question, rather than make a bad offer that erodes user trust in the store.”<sup>798</sup>

- (331) In the examples above, Valve frames enforcement of its PMFN Policy as a way to protect its users from regretting Steam purchases and to ensure users have a good experience on Steam. However, as discussed in Section 6 and above in Section 7, consumers are *worse off* and not protected as Valve suggests, due to Steam’s monopoly power and the maintenance of that monopoly power through Valve’s PMFN Policy. [REDACTED]

[REDACTED]<sup>799</sup> Steam’s monopoly power has limited the number of viable alternative platforms available to users and has resulted in a lack of innovation and improvement of Steam features, impacting consumers’ ability to choose a

platform that best fits their needs.<sup>800</sup> Further, Valve’s high commission rate also leads to inflated consumer prices, as developers compensate for the high commission rate by passing through part of the commission to consumers.<sup>801</sup> Valve’s PMFN Policy maintains these inflated consumer prices on alternative platforms in the relevant market and forces alternative platforms to shift their platform design and business models closer to Steam’s high fee model.<sup>802</sup> As detailed below in Sections 8.3.5 and 8.4, absent Steam’s PMFN Policy, Steam’s but-for commission rate would be lower than the effective commission rate, and those savings would be at least partially passed through to the consumer, leading to lower consumer prices. Thus, despite Valve’s claim that their PMFN Policy can limit consumer regret to promote a positive experience on Steam, consumers would ultimately benefit from the removal of the PMFN Policy and a more competitive market. Indeed, a possible “consumer regret” argument would mean little more than Valve regrets that consumers learn that lower prices are available from other stores.

## 8. Economic Quantification of Class-Wide Damages

---

### 8.1. Overview

- (332) Below, I review the literature on one-sided and two-sided platforms, and in that context, I examine Steam’s pricing behavior and conclude that, while it acts as a two-sided platform in facilitating transactions between publishers and users, its pricing structure is implemented on only one side of the platform. This allows me to apply economic models focusing on a single price. While the *direct* pricing on the Steam platform is one-sided in that Valve only collects fees from publishers, the commission rate charged impacts consumer prices, as discussed above and in this section. As such, Valve’s pricing to publishers affects *both* sides of the market.
- (333) I introduce the Landes and Posner model<sup>803</sup> to demonstrate how Steam’s price and quantity would be lower in the but-for world under a shifted firm-specific demand curve. Using the intuition from Landes and Posner, I describe my model for determining the but-for price. First, I calculate real-world values that correspond to the various inputs of the model. Using these real-world input values and an estimate of the but-for market share using shares by publisher, I determine Steam’s commission rate in the but-for world, and therefore have a methodology to determine damages for each putative class member based on the available transaction data.
- (334) My model derived from Landes and Posner confirms my conclusion that all or virtually all class members are impacted. Specifically, my model describes the but-for competitive equilibrium reached after platforms enter the market during the period of time after Valve’s PMFN is eliminated. In that competitive equilibrium, Valve’s but-for commission rate is substantially lower than in the real world, and lower even than the commission rate in the interim state market described by my Platform Competition Model. In this way, my impact analysis and my damages analysis together describe the transition from a market dominated by Valve, to one with increased competition, reduced pricing, and increased output (Platform Competition Model), to a fully competitive market with much lower pricing (Landes and Posner model) and increased output. But for Valve’s PMFN Policy, the market would have reached this end state by no later than January 28, 2017 and likely earlier.

<sup>803</sup> Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996.

(335) Rochet and Tirole (2006) define a two-sided platform as:<sup>804</sup>

. . . one in which the volume of transactions between end-users depends on the structure and not only on the overall level of the fees charged by the platform. A platform’s usage or variable charges impact the two sides’ willingness to trade once on the platform and, thereby, their net surpluses from potential interactions; the platforms’ membership or fixed charges in turn condition the end-users’ presence on the platform. The platforms’ fine design of the structure of variable and fixed charges is relevant only if the two sides do not negotiate away the corresponding usage and membership externalities.

(336) A key feature of Rochet and Tirole (2006)—and the one that makes my analytic approach appropriate for analyzing a platform such as Steam—is that a market is defined as one-sided if the quantity of transactions depends *only* on price level and not price structure across the two sides:<sup>805</sup>

Consider a platform charging per-interaction charges  $a^B$  and  $a^S$  to the buyer and seller sides. The market for interactions between the two sides is one-sided if the volume  $V$  of transactions realized on the platform depends only on the aggregate price level

$$a = a^B + a^S$$

*i.e.*, it is insensitive to reallocations of this total price  $a$  between the buyer and the seller. If by contrast  $V$  varies with  $a^B$  while  $a$  is kept constant, the market is said to be two-sided.

(337) Per Rochet and Tirole, Steam’s pricing model is one-sided. Steam has historically only priced on one side of the market (that is, to developers). Steam’s headline commission rate, historically set to a flat 30% and more recently tiered according to game revenues, is directly charged to publishers and is deducted by Valve from the price charged by publishers to consumers.<sup>806</sup>

(338) Steam calculates its commission as a percentage of revenue, and not a fixed amount per unit sold;<sup>807</sup> thus it qualifies as an *ad valorem* fee on the revenues generated by developers. In a

<sup>806</sup> While the price Steam charges to publishers may impact publisher’s pricing to consumers (this is referred to as “marginal price pass through”), the only direct price charged by the platform (*i.e.*, Steam) is the commission rate to publishers. For further discussion on pass through, see Section 8.4.

paper from 2003, Rochet and Tirole describe three conditions under which a system such as Steam’s should be considered price-neutral, all of which apply here.<sup>808</sup>

- a. Lack of transaction costs. Neutrality of pricing requires a lack of “frictions that make it costly for one side of the market to pass through a redistribution of charges to the other side. Often these transaction costs are associated with small stakes for individual transactions[.]” Such frictions are not present on Steam.
- b. Lack of volume-insensitive costs. Neutrality of pricing requires that there are no costs “that a) are influenced by the platform and b) are not proportional to the number of transactions on the platform.” Such costs are not present on Steam.<sup>809</sup>
- c. Lack of constraints on pass-through. Neutrality of pricing requires that the platform not “limit the extent of pass-through.” Valve does not actively manage pass-through.

(339) Rather than pricing separately on both sides of the market, Steam has opted for an agency model in which a supplier sets the final retail price for its good or service and the online retailer keeps a share of the revenue generated by a transaction between a supplier and a consumer.<sup>810</sup> Products such as “e-books, applications for mobile devices . . . , car insurance, and hotel reservations have been sold online using the agency model.”<sup>811</sup> The agency model is also used in the Boik-Corts model of platforms, described above. Boik and Corts include a single platform fee and derive implied demand for transactions as a function of a platform’s fees and their competitor’s fee.<sup>812</sup> This contrasts with the “wholesale model” in which “suppliers set wholesale prices and retailers set retail prices[.]”<sup>813</sup>

(340) I model the but-for world by assuming that Steam would continue to use an agency model, pricing to one side of the market as a share of retail price. This allows publishers to set prices for their products and decide how much (if any) of Steam’s fees to pass through to consumers. Indeed, when faced with the option to switch to a wholesale model for a particular publisher, Valve rejected this option and retained its agency pricing model.<sup>814</sup> Thus, I evaluate Steam’s but-for price under models with a single, direct price to one side of the platform.

## 8.2. The Landes and Posner (1981) model

(341) Landes and Posner present a model that relates firm market power to the price it sets (relative to marginal cost). Landes and Posner define market power as “the setting of price in excess of marginal cost” and formalize their measure of market power using the Lerner Index, as expressed below:<sup>815</sup>

<sup>815</sup> Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 940.

Landes and Posner (1981) explain that the “the Lerner index is a measure of a firm’s market power.” See:

Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 941, fn 8.

$L_i$  is the Lerner Index for firm  $i$ ,  $P_i$  and  $C_i'$  are respectively price and marginal cost at the firm’s profit-maximizing output, and  $\epsilon_i^d$  is the firm’s elasticity of demand. See:

Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 940.

Per the equation above, a higher firm demand elasticity means that the quantity the firm sells is more responsive to the price they set. If the quantity reduces more in response to a price increase (demand elasticity is higher), firms that are maximizing their profits will not mark up their prices to the same extent.

Lerner, A. P. (1934), “The Concept of Monopoly and the Measurement of Monopoly Power,” *The Review of Economic Studies* 1(3): 157–175.

$$L_i = \frac{(P_i - C'_i)}{P_i} = \frac{1}{\epsilon_i^d}$$

- (342) Landes and Posner explain that the Lerner Index,  $L_i$ , of firm  $i$  indicates the relative size of the monopoly mark-up of price,  $P_i$ , over marginal cost,  $C'_i$ , by firm  $i$ .<sup>816</sup> The Lerner Index illustrates the relationship of the firm’s market power to the firm’s price elasticity of demand,  $\epsilon_i^d$ .<sup>817</sup> Firm  $i$ ’s price elasticity of demand quantifies the relationship between the quantity demanded of firm  $i$ ’s output and the price that firm  $i$  charges; more formally, it is the percentage change in quantity demanded for firm  $i$ ’s output in response to a given percentage change in firm  $i$ ’s price.<sup>818</sup> Landes and Posner explain that “[s]ince the Lerner [I]ndex is a measure of a firm’s market power, the relevant elasticity is the firm elasticity of demand, for it is the response of the firm’s output to change in its price that determines the degree to which it has market power.”<sup>819</sup>
- (343) The Lerner Index is inversely related to a firm’s price elasticity of demand and shows that a higher price elasticity of demand for the firm’s product will result in a lower profit-maximizing mark-up over cost (and vice versa). This makes intuitive sense, as a high elasticity of demand indicates consumers are more sensitive to price changes, all else equal.
- (344) The Lerner Index is regarded by many as the “best-known measure of monopoly power.”<sup>820</sup> As discussed above, Steam’s pricing model is price neutral, meaning that no matter who ultimately remits the fee to Valve, the amount the consumer ultimately pays for a game is not affected. This is because the pass-through of the fee adjusts based on who remits the payment.<sup>821</sup> When such neutrality holds, two-sided markets can be treated as one-sided

markets.<sup>822</sup> This approach is consistent with the Boik-Corts model discussed in Section 7.2 where a single fee is used, just like Steam’s actual pricing strategy. In the Boik-Corts model, the platform maximizes its implied demand function with respect to the fee, which means the Lerner Index holds. In fact, I show in Appendix A.3 that the equations used in the Boik-Corts model can be combined and simplified to the Lerner equation, giving the same value for Steam’s real-world elasticity of transaction with respect to fees in both approaches.

- (345) Landes and Posner expand on the standard Lerner Index formula by explaining that the firm elasticity of demand—and by extension the firm’s market power—can be derived using firm *i*’s market share ( $S_i$ ), the market elasticity of demand ( $\epsilon_m^d$ ), and the supply elasticity of competing (or “fringe”) firms ( $\epsilon_j^s$ ).<sup>823</sup> The supply elasticity of fringe firms is defined as the percentage increase in the quantity supplied by fringe firms in response to a one percent change in the market price.<sup>824</sup> Landes and Posner derive the following equation:

$$\epsilon_i^d = \frac{\epsilon_m^d + \epsilon_j^s (1 - S_i)}{S_i}$$

- (346) Using the above expression, Landes and Posner rewrite the Lerner equation, demonstrating that market power is a function of firm *i*’s market share ( $S_i$ ), the market elasticity of demand ( $\epsilon_m^d$ ), and the supply elasticity of fringe firms ( $\epsilon_j^s$ ).<sup>825</sup>

$$L_i = \frac{(P_i - C_i')}{P_i} = \frac{1}{\epsilon_i^d} = \frac{S_i}{\epsilon_m^d + \epsilon_j^s (1 - S_i)}$$

- (347) Landes and Posner observe the following:<sup>826</sup>
- a. Holding all else constant, higher market demand elasticity yields higher firm elasticity of demand, resulting in a lower Lerner Index and lower mark-up over cost.
  - b. Holding all else constant, higher elasticity of supply of fringe firms yields higher firm elasticity of demand, resulting in a lower Lerner Index and lower mark-up over cost.

c. Holding all else constant, higher market share yields a lower firm elasticity of demand, resulting in a higher Lerner Index and a higher mark-up over cost.

(348) This model identifies two mechanisms that will act to increase Steam’s firm demand elasticity and lower its but-for price. First, absent the PMFN, Steam’s market share,  $S_i$ , would be lower, leading to a greater firm-specific elasticity of demand. See further discussion and calculation of that market share in Section 8.3.4.

(349) Second, without the PMFN, fringe elasticity of supply would be higher, all else equal. In the presence of a PMFN, fringe firms have a harder time attracting new game developers to their platforms than they would absent a PMFN. In the real world, while fringe platforms can offer discounted commission rates relative to Steam, because of the PMFN, game developers cannot pass through savings to consumers via lower retail prices if they are also distributing through Steam. Without the ability to compete on price, fringe platforms have a harder time attracting consumers to their platforms and, in turn, this leads to difficulty in attracting developers. In the but-for world, with meaningful competition possible between platforms, developers would be able to use lower commission rates offered by fringe platforms to cut retail prices and attract customers, resulting in both an increase in profit margin and quantity sold. This would be attractive to publishers, meaning publishers would more readily supply their games to those platforms that are part of the fringe. Thus, the fringe elasticity of supply would be higher in the but-for world.

### 8.3. Estimation of the but-for price

(350) I combine the insights gleaned from the Landes and Posner model with assumptions regarding the demand curve for Steam’s digital third-party distribution services to calculate Steam’s commission rate in the but-for world. I start by evaluating the elasticity of demand for Steam’s digital third-party distribution services in the real world. Using that elasticity as an input, I model Steam’s demand based on a linear demand curve. Assuming that Steam’s demand curve in the but-for world would be parallel to its demand curve in the real world, I then use my estimated Steam but-for market share to calculate Steam’s but-for commission rate.<sup>827</sup>

---

<sup>827</sup> As discussed in Section 3.3.5, there are instances in which users gain access to a game played through Steam through the acquisition of a Steam Key rather than the purchase of the game directly on Steam. In such instances, those purchases are not subject to the Valve commission charge. In the but-for world, I assume that Steam Keys would have been provided and used in the same manner as in the real world and focus my determination of the but-for price solely on those purchases made through Steam and thus subject to the Valve commission charge.

### 8.3.1. Steam’s real-world Lerner Index

(351) I first evaluate Steam’s Lerner Index in the real world. Recall that the firm’s Lerner Index is a function of its pricing and its marginal costs.

$$L_i = \frac{(P_i - C_i^d)}{P_i} = \frac{1}{\epsilon_i^d}$$

(352) Valve has had a historic headline commission rate of 30% on sales of third-party PC content. From January 28, 2017 through December 31, 2022, Steam generated an effective commission rate of [REDACTED],<sup>828</sup> a rate that includes periods before and after the implementation of the tiered commission rate.<sup>829</sup> For purposes of this analysis, I conclude that the [REDACTED] rate is a reasonable proxy for the effective market commission rate, given Steam’s dominance in the marketplace; the effective market rate charged by Valve is what is relevant, rather than the specific rate paid by each publisher.

(353) I similarly use Valve’s P&Ls over the period of 2017 through 2021 to determine Steam’s costs.<sup>830</sup> I convert these costs to a share of transaction value for easy comparison to the commission rate set by Valve. Steam’s total cost of sales during this time were approximately [REDACTED] of transaction value;<sup>831</sup> Steam’s total operating expenses during this time (including allocated administrative expenses) were approximately [REDACTED] of transaction value.<sup>832</sup> Steam’s total taxes (including allocated admin taxes) were [REDACTED] of transaction value. Steam’s cost of sales plus its total operating expenses plus its taxes represent approximately [REDACTED] of transaction value from 2017 through 2021. See Attachment D-7.

---

<sup>828</sup> The calculations presented in this section use rounded values, though I use more precise values in my attachments. Thus, they may differ slightly.

<sup>829</sup> Valve Transaction Data, 1/28/2017–12/31/2022. See: "05\_Damages.R"

<sup>830</sup> Valve’s P&L data is set forth on an annual basis and is available through 2021, and this calculation and all subsequent calculations can be performed on such a basis.

<sup>831</sup> [REDACTED] See:  
Valve, Valve P&L Statements, c. 2022 (VALVE\_ANT\_2755012\_HIGHLY CONFIDENTIAL\_ATTORNEY EYES ONLY.xlsx.)

<sup>832</sup> [REDACTED] See:  
Valve, Valve P&L Statements, c. 2022 (VALVE\_ANT\_2755012\_HIGHLY CONFIDENTIAL\_ATTORNEY EYES ONLY.xlsx.)

(354) The Lerner Index is predicated on firms profit maximizing, that is, pricing based on marginal costs.<sup>833</sup> Rather than calculating Steam’s marginal economic costs, I adopt a conservative approach and use all of the accounting costs outlined above. In platform firms like Valve, high fixed costs and low marginal costs are common and result in average total costs that are higher than marginal costs.<sup>834</sup> Using a higher cost as the basis for price setting will result in a higher but-for commission rate.<sup>835</sup> The Lerner Index relates price to marginal costs through a scaling factor, and thus a greater cost will result in a greater but-for price, all else equal.

(355) The resulting Lerner Index for Steam from January 28, 2017 through December 31, 2022 is [REDACTED]; Valve’s resulting firm elasticity of demand for its distribution services is approximately [REDACTED].<sup>836</sup>

### 8.3.2. Linear demand modeling

(356) I model Steam’s demand as linear and use Steam’s real-world firm elasticity of demand to calculate the slope of Steam’s demand curve.<sup>837</sup> An assumption of linear demand is standard

---

<sup>833</sup> The Lerner Index is derived using the equation for firm profits and by assuming firms try to maximize their profits. A firm’s profit-maximizing price is established when the firm sets its marginal revenue equal to marginal cost. See:

Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 984–985.

(“The industries that are the hallmark of the “new economy” are characterized by a special cost structure. From software to semiconductors, digital entertainment to biotechnology, and in innovative fields more generally, the standard cost pattern entails sunk outlays that are large and must be incurred over and over again, but the marginal cost of serving an additional customer-is virtually negligible. As economists are well aware, this is only a special case of a more general circumstance, the case of scale economies, where the prices of a firm’s products, if set equal to the corresponding marginal costs, will condemn the enterprise to losses.”)

<sup>835</sup> Note that in cases where average total costs are higher than marginal costs, the competitive price is equal to the average total cost, because “a firm that prices at marginal cost cannot cover its fixed costs (costs that do not vary with output), such as plant and equipment or research and development (‘R&D’).” See:

Kirkwood, John (2018), “Market Power and Antitrust Enforcement,” *Boston University Law Review* 98: 1169–1227, at 1175–1176.

While this changes the interpretation of the markup over marginal costs, it does not impact my use of the markup over marginal cost in the model, because the derivation of the Lerner Index comes from the profit maximizing condition (which is unchanged in a high fixed cost market) and not the competitive price. See:

Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 984–985.

<sup>836</sup> Using the Lerner Index formula, I obtain a Lerner Index of [REDACTED]. This gives a firm elasticity of demand of [REDACTED].

<sup>837</sup> Demand functions define the “relationship between the price of a good and the quantity demanded[,]” where the quantity demanded is the “amount of a good that buyers are willing and able to purchase.”

Mankiw, N. Gregory (2018), *Principles of Economics*, 8th ed., Boston, MA: Cengage Learning, at 67.

practice in the economics literature. For example, Boik and Corts employ a linear demand framework and show that it satisfies all the assumptions maintained in the general demand framework.<sup>838</sup> Chone and Linnemer provide a detailed history of the extensive use of linear demand models in economics, noting that “[s]ome researchers find it so natural to use linear (direct or inverse) demands (and to derive them from a [Quasilinear Quadratic Utility Model]) that they do not try to give a source[.]”<sup>839</sup>

(357) The standard formula for firm-specific demand elasticity for firm  $i$  is as follows.<sup>840</sup>

$$\epsilon_i^d = -\frac{P_i}{Q_i} \frac{\partial Q}{\partial P}$$

(358) In a linear demand model,  $-\frac{\partial Q}{\partial P} = m$ , where  $m$  is a constant.<sup>841</sup> Thus,

$$\epsilon_i^d = m \frac{P_i}{Q_i}$$

(359) Plugging the linear elasticity of demand into the Lerner Index found above results in the following equation.

$$L_i = \frac{(P_i - C_i')}{P_i} = \frac{1}{\epsilon_i^d} = \frac{1}{m \frac{P_i}{Q_i}}$$

We first assume that an unspecified underlying general demand function induces a unique optimal pricing rule for the single multi-product seller, yielding a differentiable and well-behaved implied demand function on transaction fees,  $q_i^k(f)$ . We later assume that the underlying demand function is a familiar linear differentiated-products demand function, which we show satisfies all of the assumptions we maintain in the general demand case.”)

(“The usage of a Linear Demand System for differentiated goods (henceforth LDS) is widespread in oligopoly theory, especially when closed-form solutions are needed.”)

Similarly, they say: “By analogy, no sane economist would look for a reference when using a linear demand like  $D(p) = a - bp$ .”

<sup>840</sup> Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 985.

<sup>841</sup> In this case, the linear demand for firm  $i$  takes the form  $q_i(P) = A - mp_i + \phi(p_j)$ , where  $\phi(p_j)$  is a general function allowing me to be somewhat agnostic to the impact of the opposing firms’ price on quantity since I only need the derivative with respect to  $p_i$ . This gives  $\frac{\partial Q}{\partial P} = -m$ . As an example, Boik and Corts use  $q_i(P) = A - mp_i + dP_j$ . See:

Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 111.

(360) This can then be simplified (dropping the subscripts for readability) as follows.

$$(P - C) = \frac{Q}{m}$$

(361) In the real world, Steam’s effective commission rate is [REDACTED], and its firm elasticity of demand is approximately [REDACTED]. I quantify  $Q$  (quantity) as a market share rather than transacted dollars; this will not affect the result, it simply results in a different interpretation of  $m$ .<sup>842</sup> I use [REDACTED] as Steam’s real-world market share, as found in Attachment E-1. Therefore,  $m$  is equal to approximately [REDACTED].<sup>843</sup>

### 8.3.3. Parallel shift in Steam demand

(362) Next, I use the properties of linear demand and assume demand curves in the but-for world are parallel to demand curves in the real world. This simplifies the Landes and Posner model and enables the calculation of Steam’s but-for commission rate.

(363) To find the but-for price, I must determine  $m$ , the inverse slope of Steam’s but-for demand curve,  $C$ , Steam’s but-for marginal costs, and  $Q$ , Steam’s but-for quantity.

(364) I assume that  $m$  is the same in the real and but-for worlds. This is equivalent to assuming that the absence of the PMFN shifts Steam’s demand curve so that it is parallel to its real-world demand curve. Removing the PMFN would decrease the (absolute value of the) slope of the firm demand curve (*e.g.*, a linear firm demand curve would become flatter), which implies an increase in (the absolute value of)  $m$ , because the quantity sold on a platform is more responsive to fees without a PMFN. By instead holding the slope (and by extension  $m$ ) fixed, I am underestimating the but-for (absolute) value of  $m$ , therefore overestimating the mark-up over cost in the but-for world (and thus overestimating the but-for commission rate). That is, my estimate of the but-for commission rate is necessarily conservative.

---

<sup>842</sup> Dividing  $Q$  by the market quantity converts it into a market share.

To see this more explicitly, let  $Q^m$  be the current market quantity in dollars; the market share for Steam then is  $Q_i = \frac{Q}{Q^m}$ .

Now let the value of  $m$  calculated with market shares be defined as  $m_i = \frac{\partial Q_i}{\partial P} = \frac{\partial \frac{Q}{Q^m}}{\partial P}$ . Together, this gives the following.

$$\frac{Q_i}{m_i} = \frac{\frac{Q}{Q^m}}{\frac{\partial Q_i}{\partial P}} = \frac{\frac{Q}{Q^m}}{\frac{\partial \frac{Q}{Q^m}}{\partial P}} = \frac{\frac{1}{Q^m} \frac{Q}{\partial P}}{\frac{1}{Q^m} \frac{\partial Q}{\partial P}} = \frac{Q}{m} = (P - C)$$

<sup>843</sup> [REDACTED]

(365) Multiple models applicable to this case show that in the but-for world,  $m$  would be greater than in the real world. As I discussed above in Section 8.2, in the Landes and Posner (1981) model, the fringe elasticity of supply would increase without a PMFN. That same intuition applies directly to the change in both Valve and fringe firm quantities with respect to the price. The following equation shows how, according to the Landes and Posner (1981) model,  $m$  is related to the change in market demand with respect to the price and the change in quantity supplied with respect to price.<sup>844</sup>

$$m = -\frac{\partial Q_i^d}{\partial P} = -\frac{\partial Q_m^d}{\partial P} + \frac{\partial Q_j^s}{\partial P}$$

(366) This equation demonstrates why if  $m$  were not held constant, and, instead, I calculated a but for value  $m^{bf}$  and a real-world value  $m^{rw}$  it would be the case that  $m^{bf} > m^{rw}$ . First, without a PMFN, fringe firms will increase their quantity supplied by more for a given price change since they would be able to compete on price. This implies  $\frac{\partial Q_j^s}{\partial P}$  is larger in the but-for world. Together, these two points imply  $m$  is larger in the but for world or  $m^{bf} > m^{rw}$ . My linear model with a parallel shift in demand holds  $m$  constant, which is conservative. This can be seen from the equation above  $P - C = \frac{Q}{m}$ , a larger value for  $m$  leads to a smaller markup over cost and so a lower price.

(367) The Landes and Posner model is not the only model that leads me to the conclusion that  $m^{bf} > m^{rw}$ . In Appendix A.4 I show that in the Boik- Corts model, removing PMFNs more than doubles the change in Steam’s quantity with respect to price  $\left(\frac{\partial Q_i^d}{\partial P}\right)$ , which implies  $m$  would more than double in the but-for world without a PMFN in place.

(368) I assume that Steam’s costs in the but-for world as a share of transaction value are equivalent to those in the real world, that is, [REDACTED]. See Attachment D-7.

(369) Lastly, I analyze Steam’s but-for market share below in detail.

#### 8.3.4. But-for market share

- (370) Steam’s but-for market share can be evaluated using a framework based on real-world outcomes from the relevant market. Below, I describe a method for determining Steam’s but-for market share based on Steam revenues generated by Valve-published games and Steam revenues generated by other publishers that later engaged in digital PC game distribution.<sup>845</sup>
- (371) Successful games can drive platform adoption and ultimately platform success. Valve used its highly popular game, *Half-Life 2*, to attract users to Steam in the platform’s early years, that is, around 2004. See Section 3.3. Similarly, Epic leveraged the success of *Fortnite* to accelerate consumer uptake of its Epic Game Store, which launched in late 2018. See Section 7.4. The benefits to a game distribution platform offering exclusive, popular titles have been acknowledged by numerous industry participants. For example, a 2022 presentation from publisher 2K—in which the company considers the business case for operating a stand-alone launcher—notes that “[e]xclusivity can be highly effective at ‘drawing’ users to the platform[.]”<sup>846</sup> The presentation also noted that, “[w]ithout exclusivity, or other offers, our Launcher offers limited value proposition over Steam/Epic[.]”<sup>847</sup> A presentation from Epic Games about EGS listed Epic’s ability to secure major timed exclusives as one of two elements of Epic’s “[s]trategy to building a \$1-2 billion PC games business fast”<sup>848</sup> A 2018 internal presentation on EGS stated that “exclusive 2<sup>nd</sup> Party titles” would be “meaningful in the long run[.]”<sup>849</sup> A 2021 internal Activision-Blizzard presentation on battle.net’s platform strategy listed first- and third-party “premium, exclusive PC & mobile games” as an element of battle.net’s platform strategy.<sup>850</sup> A 2015 document in which Amazon presents its plan to “build a PC game store on Twitch[.]” states that “content is the most important factor in the success of a gaming platform” and that “exclusive games from Amazon Games Studios” would help differentiate Amazon’s offering.<sup>851</sup>

---

<sup>845</sup> To demonstrate how this method generates a but-for market share for Steam, it is necessary to adopt assumptions about which publishers are included in the calculation as well as the relevant time period. I reserve the right to alter the assumptions presented below in a subsequent report in which I evaluate the merits issues in further detail.

<sup>846</sup> 2K, “2K Stand-Alone Launcher Business Case,” 2/2022 (TAKE2-00000066-094, at TAKE2-00000086).

- (372) Multiple publishers—generally those with several popular titles and franchises—have attempted to transition from successful game developer and publisher to distributor of PC gaming content. These publishers include Activision (battle.net), Bethesda (Bethesda.net), CD Projekt (GOG), EA (Origin), Epic (EGS), Microsoft (Microsoft Store), Rockstar (Rockstar Games Launcher), and Ubisoft (Uplay). However, as described in Section 6.2, most of these entrants in the market did not succeed or have struggled to build their market share.
- (373) In the but-for world, the newly entering or existing fringe platforms would have been able to better attract third-party PC content by offering publishers a greater share of transaction value so that such publishers could offer their games at lower prices on these platforms. These lower prices would, in turn, help to attract gamers to the platform. But for Valve’s alleged anticompetitive conduct, publishers that continue to operate their distribution platforms would likely have garnered a larger share of the market, and it is likely that at least some of the publishers that stopped operating their distribution platforms would have continued to operate their platforms. Therefore, the but-for world would also include publishers that operate or previously operated PC game distribution platforms as competitors to Steam.
- (374) Valve’s ability to attract gamers to Steam through its first-party game offerings also contributed to the platform’s ability to attract third-party developers (that is, build network effects). As I note above, other publishers have attempted to utilize a similar model to build their own digital PC game distribution platforms. I thus model the but-for market shares for Valve as well as the publishers that engaged in digital PC game distribution based on the relative success of their games on Steam. To quantify the success of publishers’ games, I use a given publisher’s share of revenues on Steam among the publishers that have attempted to create distribution platforms as a proxy for the market share of their platforms in the but-for world. However, to the extent that these publishers also publish elsewhere, this approach would likely bias the publishers’ shares downward and thus Steam’s share upward. Hence, I focus on a period in which publishers likely would have begun to develop their own platforms in the but-for world, but where none had yet done so in the real world, likely generating all or most of their revenues through Steam.
- (375) To calculate each publisher’s share of revenues on Steam, I focus on the period between 2008 and 2012. The year 2008 is used as the starting point to calculate revenues, as large publishers such as EA (2008) and Ubisoft (2008) did not offer games on Steam during the platform’s initial years. The year 2012 is used as the ending point to calculate revenues, as publishers such as EA began to launch new titles exclusively on their own platforms beginning in 2012. Figure 6 below shows the publishers’ shares of revenue on Steam.

**Figure 6: Share of Steam Revenues Among Selected Publishers, January 2008-December 2012**

[illegible]

(376) Steam's share of revenues among publishers that operate or operated a PC game distribution platform was [REDACTED] between January 2008 and December 2012.<sup>852</sup> As I note above, the presence of successful games is a key driver of platform success. The publishers shown in Figure 6 above released [REDACTED] of the top-50 best-selling games on Steam between January 2010 and December 2012.<sup>853</sup> However, because other factors likely also contribute to platform success, *e.g.*, the user experience, social features, discovery tools, etc., I adopt Valve's [REDACTED] share of revenues as Steam's but-for market share.

### 8.3.5. But-for commission rate

(377) I now have the information I need to solve for Steam's but-for commission rate. I calculate the but-for effective commission rate to be 17.7%,<sup>854</sup> representing a [REDACTED] decrease from the effective Steam commission rate during the period from January 28, 2017 through December

852 Note that these shares do not consider revenue for titles by Epic Games. My estimate for Steam's market share is necessarily conservative—meaning that it is *higher* in this but-for consideration—because it excludes Epic's position in the market.

854 ■■■■■■

31, 2022. In addition to the steps laid out above, the algebraic steps are detailed in Appendix A.2.<sup>855</sup>

(378) The estimate of the but-for commission rate is conservative for several reasons. First, I use a conservatively high estimate for marginal costs. Steam faces high fixed costs, so its average costs are higher than its marginal costs.<sup>856</sup> As illustrated by the Lerner Index, higher costs imply that a smaller portion of Steam’s current price is a result of its market power, leading to an artificially lower level of estimated market power. With lower estimated market power, my model shows that changes in Steam’s market share would have less of an impact on the price it charges. When considering the impact of a decrease in Steam’s market share, as I am in this case, higher costs would result in a smaller change in price, and so a higher but-for price.<sup>857</sup> Additionally, my estimate is conservative because I hold the slope of the demand curve fixed, rather than following the Boik and Corts model which finds that Steam’s but-for quantity demanded would be more responsive to fee changes than its current demand. A more thorough analysis of this point is done in Appendix A.4.<sup>858</sup>

## 8.4. Pass-through rate(s)

### 8.4.1. Overview

(379) Above, I present an approach for computing but-for take rates, or commission rates. Game publishers in the but-for world compete against each other in the retail market in which PC games are sold. All else equal, game publishers should ordinarily respond to a decrease in the *commission rate* by decreasing their game *price*. That would result in a lower end price for the game purchaser, thus benefiting both “sides” of the Steam platform. As a preliminary matter, I understand that for purposes of assessing class-wide impact in this case, there is no

---

<sup>855</sup> The but-for effective commission rate varies slightly according to the but-for market share used. For example, if I instead use a but-for Steam market share of 50%, the but-for effective commission rate equals 20.5%.

. See Appendix A.2 for an explanation of the equations.

I reserve the right to calculate the but-for market share through alternative methods.

<sup>856</sup> Attachment D-6 shows that both gross margin and operating margin are relatively flat despite changes in Steam’s commission revenue over time.

<sup>857</sup> This intuition can be seen by rearranging the equation for the but for price from Appendix A.2 to get  $P^{bf} = \frac{Q^{bf}}{Q^{rw}} P^{rw} + C' \left(1 - \frac{Q^{bf}}{Q^{rw}}\right)$ . Since the quantity is decreasing, the term in front of the marginal costs is positive meaning that as costs increase, the but for price increases.

<sup>858</sup> Appendix A.4 shows that the Boik-Corts model can place a more precise bound on the but for slope of demand that results a but for price of .

need to consider the consumer “side” of the platform. Unless game publishers pass-through 100% (or more) of the commission savings, which is highly unlikely to begin with and is a proposition for which there is no evidence, game publishers will suffer *some* injury from the inflated commission rates, that is, the overcharge. Thus, the matter of pass-through is relevant only to the estimation of damages.

- (380) In this case, “pass-through” is the dollar change in price divided by the dollar change in cost. A seller’s price is determined, in part, by the costs that the seller incurs to make and/or sell the good in question. If costs change, pass-through measures how much of that cost change is passed on to the consumer as a change in price. Consider a seller of widgets, where the price set is \$10 when the cost of creating that good by the seller is \$5. If the cost of the widget decreased to \$4, a decrease in the price to \$9 would reflect a 100% pass-through rate (\$1/\$1). On the other hand, if the price did not change despite the decrease in the cost, this would represent a 0% pass-through rate (\$0/\$1). If the price decreased by \$0.50, this would represent a 50% pass-through rate (\$0.50/\$1).
- (381) Commissions such as the one imposed by Steam are akin to an *ad valorem* tax. This tax levies a fee as a percentage of the price of a product when it is sold.<sup>859</sup> Steam’s commission rate qualifies as an *ad valorem* fee, because Steam calculates its commission rate as a *percentage* of revenue. As such, Steam’s commission rate is effectively an *ad valorem* tax on the revenues generated by developers. This echoes conclusions by researchers such as Rochet and Tirole (2003), who characterize video game platforms’ business models of extracting developers’ revenues as a tax on developers.<sup>860</sup>
- (382) Numerous studies have explored the theoretical conditions and settings that influence pass-through rates. These include, but are not limited to, the slope of the demand curve, the shape of the demand curve, the slope of the supply curve, and the degree of market competition.<sup>861</sup> Given the variety of factors that can have an impact, pass-through rates can range widely. The actual pass-through rate can further be affected by other real-world market

considerations, such as network effects, and real-world market frictions, such as menu costs, that limit price changes, despite potential changes in costs.<sup>862</sup>

(383) Weyl and Fabinger (2013) outline factors that influence the pass-through of unit taxes in a variety of market settings.<sup>863</sup> They show that pass-through depends on a firm’s market power, the shape of the demand curve (*i.e.*, convex or not), as well as elasticity of supply. First, they show that a higher degree of market power moves a firm more toward the monopoly case where pass-through tends to be smaller.<sup>864</sup> Second, they show that when elasticity of supply is smaller, pass-through tends to be smaller as well.<sup>865</sup> Third, they show that in a monopoly, when the demand curve is more convex, pass-through tends to be greater.<sup>866</sup> Finally, the authors add that in platform markets, suppliers must weigh the potential loss of network benefits when passing through higher taxes to consumers in the form of higher prices.<sup>867</sup> This suggests that in the presence of network effects, pass-through of higher costs to consumers is likely to be lower than that predicted by standard theoretical models.

(384) Hackner and Herzing (2016) impose structure on demand by assuming it to be linear and theoretically derive how pass-through rates relate to key market characteristics.<sup>868</sup> In particular, they find that pass-through of an ad valorem tax increases as the product variety/range of firms increases, as the degree of market concentration decreases, and as the degree of product differentiation decreases.<sup>869</sup> As a smaller product range, higher market concentration, and greater product differentiation are characteristics of imperfectly competitive markets, this suggests that pass-through rates are lower in imperfectly

competitive markets compared to perfectly competitive markets when product demand is linear.<sup>870</sup>

(385) Overall, many factors influence pass-through, including the slope and shape of the demand curve, the slope and shape of the supply curve, and the degree of market competition.<sup>871</sup> When product markets are perfectly competitive, theory predicts that pass-through rates will be near 100%.<sup>872</sup> As markets become more imperfectly competitive or monopolistic, theory predicts that pass-through rates will tend to fall, especially when elasticity of supply is small and the demand curve is concave, linear, or not highly convex.<sup>873</sup>

#### 8.4.2. Empirical estimate

(386) In the economics literature, it is well documented that pass-through rates can be impacted by economic conditions such as the competitive pressures faced by firms, the presence of substitutes, and consumer demand. Other real-world effects, such as a firm’s strategic desire to price at focal points—such as setting prices that end in .99—can also affect pass-through rates by reducing the number of prices a firm is willing consider when setting prices. For example, if a firm experiences a small marginal cost decrease, the firm may be unwilling to lower its prices if doing so results in a new price that is not one of the firm’s focal point prices (e.g., \$5.99 to \$5.74). As focal point prices may constrain a firm’s decision to pass through marginal cost savings, I first consider the evidence of focal point pricing on Steam.

(387) I first consider the possibility that video games sold on Steam are subject to industry focal pricing points, such as \$59.99 for a triple-A game.

(388) Figure 7 below shows the top-10 transactions prices observed on the Steam platform. The top ten sale prices are associated with █████ of revenues from the platform and █████ of transactions on the platform. Furthermore, prices ending in .99 are associated with █████ of revenues and █████ of transactions on the Steam platform. These results suggest that focal

point pricing is likely a consideration for a substantial number of publishers on Steam, with the most popular base prices being those one cent shy of integer dollar values.

(389) Applying this to the present case, video game publishers’ and developers’ use of focal point pricing would likely impact the pricing mechanism by which a marginal cost savings may be passed through to video game purchasers. As an illustrative example, suppose a game that has a base price of \$9.99 on Steam has historically been subject to Steam’s 30% commission rate, but eventually hits \$10 million in sales after October 1, 2018 so that the game qualifies for a drop in the applicable commission rate to 25% on subsequent sales (see Section 3.3.4). Such a drop represents a marginal cost savings of approximately \$0.50 to the game publisher. Focal point pricing *could* lead a publisher to reduce the price through promotional activities and sales as opposed to changing list prices so that the focal point price can be maintained.

Even if you fall outside of the refund rules we've described, you can submit a request and we'll take a look at it.")

- (392) The only systematic change in Steam’s commission rate I am aware of is its introduction of a tiered commission system in late 2018 (see Section 3.3.4). Accordingly, my analysis focuses on base game packages (i.e. the package associated with the game itself) that have qualified for a reduction in the applicable commission rate on Steam from 30% to 25% (i.e., base games associated with a title that has had at least \$10 million in revenue since October 1, 2018). I find that, in total, 434 games qualified for Steam’s reduced 25% commission rate.<sup>879</sup> This change in commission rate functions as a reduction in a publisher’s marginal cost to distribute on Steam and thus is a reasonable way to assess potential pass-through by publishers. To isolate the impact from a single commission rate reduction, I exclude from the sample base games that subsequently transitioned to the 20% commission rate tier (i.e., base games associated with a title that has had at least \$50 million in revenue since October 1, 2018).<sup>880</sup>
- (393) To account for the use of publisher focal point pricing and discounting as a possible pass-through mechanism (as described above), my analysis focuses on effective price changes over an extended period of time. Specifically, using the daily weighted average transaction prices described above, I calculate the average effective daily price over the 360 days preceding the commission rate reduction and the first 360 days following the commission rate reduction. I remove base games from the sample that have revenues beginning less than 360 days before the commission change or revenues ending greater than 360 days after the commission change. I also remove base games from the sample that have pricing/transaction data available for less than 50% of the days in the 720-day window around the commission rate change. Note that my analysis also excludes titles that may have reached the 25% commission rate tier soon after launch (i.e., in less than 360 days).
- (394) There are 124 base game packages that meet the above criteria.<sup>881</sup> For each base game package, I use the 360-day average daily price after the commission rate change to calculate the percentage price decrease from the 360-day average daily price prior to the commission rate change.<sup>882</sup> Using the full sample, the average effective price reduction was [REDACTED] and the

median effective price reduction was [REDACTED].<sup>883</sup> Here, I use the median as a sample statistic since it is less susceptible to extreme outlier influence.

(395) To examine the potential impact of outliers, I recalculate the average and median price reductions excluding games from the sample where the magnitude of the percentage price reduction is at least 10% in absolute value (*i.e.*, less than or equal to -10% or greater than or equal to 10%). I then repeat this process using threshold values of 15%, 20%, 25%, and 30%, calculating the average and median price reductions in each instance. The results are shown in Figure 8 below.<sup>884</sup>

**Figure 8: Average and Median Price Changes**

(396) As can be seen above, the median value exhibits less volatility than the average value across samples. Thus, the use of the median values is appropriate and reasonable given the potential impact of price change outliers on the average values. The median price change values in the samples above range from [REDACTED], implying pass-through rates of approximately 20% to 25%.

<sup>884</sup> Valve Transaction Data, 3/11/2004–12/31/2022. See: "04\_Passthrough.R."

(397) The pass-through rate of 20% to 25% on the but-for commission rate would imply an approximately [REDACTED] consumer price reduction.<sup>885</sup> The models I use to estimate these values are agnostic to the process by which one would get to this average value over time. In the but-for world, Valve would face increased competition. Therefore, to consider the but-for world, one must trace out a world in which competing platforms would have offered developers lower commission rates, and developers would have passed some portion of those savings on to consumers. This would have started long ago, when Steam did not enjoy the network effects or any first-mover advantage. Thus, it is not appropriate to consider whether this change in prices would cause users *now* to switch platforms. Rather, it is more appropriate to consider whether Steam users in the but-for world would have switched earlier on in the growth of the relevant market, and whether new PC gamers would have started on a lower-cost platform rather than join Steam.

## 8.5. Overcharge and damages

(398) The total overcharge imposed on game publishers by Steam is different than class-wide damages in this matter. Total overcharge refers to all commissions taken by Valve in excess of a competitive commission rate. Some publishers who are not part of the putative class may be included in a calculation of total overcharge, *e.g.*, foreign publishers who sold only to foreign customers.

(399) To estimate class-wide damages in this matter, I include all transactions occurring on Steam, except that I exclude transactions for foreign publishers who *only* transacted with foreign consumers. That is, if a publisher based in Canada had any sales recorded with U.S. customers, all revenue associated with that publisher would be included. However, if another Canadian publisher *only* had charge volume within Canada, that publisher and its related sales would be excluded. For U.S. publishers, all global sales are considered. There are [REDACTED] publishers meeting these criteria that also have positive net revenue over the damages period in Valve’s transaction data.<sup>886</sup> Given the scope of this litigation, I limit my estimate of aggregate class-wide damages to transactions involving games, DLC, or in-app purchases.<sup>887</sup>

<sup>885</sup> Calculated as:

[REDACTED]

<sup>886</sup> Valve Transaction Data, 1/28/2017–12/31/23. See “05\_Damages.R.”

<sup>887</sup> Sales associated with hardware products, undetermined product types, or Valve as a publisher are excluded from this aggregation.

### 8.5.1. Overcharge and damages are calculated formulaically to estimate individual putative class member damages

- (400) To estimate the damages associated with an individual putative class member, I apply a consistent methodology to all putative class members. I begin with a given publisher’s dollar transaction volume (*i.e.*, revenues) between January 28, 2017 and December 31, 2022 on the Steam platform as recorded in Steam’s transaction data. Because Valve has not yet produced data for 2023, I estimate 2023 revenues by assuming they are equal to those in 2022. My methodology is replicable and can be expanded to address later years when Valve produces additional transaction records in later stages of this litigation. This assumption is likely conservative, as the [REDACTED] See Attachment D-5.
- (401) To determine the overcharge associated with a given commission rate, I scale the commission rates calculated in the transaction data by a ratio of the but-for commission rate to the overall effective commission rate in the damages period.<sup>888</sup> The effective commission rate from Valve’s transaction data is [REDACTED].<sup>889</sup> The but-for commission rate I calculate above is 17.7% (see Section 8.3.5). Next, I multiply commissions paid to Valve by [REDACTED] to arrive at a but-for commission for a given commission rate.<sup>890</sup> Finally, to determine overcharge at a given commission rate, I subtract the scaled but-for commission rate from the calculated commission rates. This is equivalent to calculating the overcharge as 33.2% of the commissions paid.
- (402) To calculate Valve’s overcharge for an individual publisher, I begin by calculating the percent overcharge for that publisher. I then apply that percent overcharge to the actual associated revenues. For instance, if a publisher faced a 30% commission rate for \$10 million sales and

<sup>888</sup> The calculations presented in this section use rounded values, though I use more precise values in my attachments. Thus, they may differ slightly.

<sup>889</sup> Valve Transaction Data, 1/28/2017–12/31/2022. See: “05\_Damages.R.”

A small share of revenue is associated with outlier calculated commission rates due to the timing of recorded partner payments or rounding error from small transactions. To be conservative, I calculate the above effective rate using the top 15 calculated commission rates between January, 28 2017 and December 31, 2022, which account for [REDACTED] of revenue in Valve’s transaction data over this time. The effective rate for all calculated commission rates associated with positive revenue is modestly higher, at [REDACTED].

<sup>890</sup> Valve Transaction Data, 1/28/2017–12/31/2022. See: “05\_Damages.R.”

For nearly all revenue in the transaction data, this ratio is applied to the exact rate calculated using partner payment information available in Valve’s transaction data. [REDACTED]

a 25% commission rate for \$20 million in sales, the overcharge would be [REDACTED]

[REDACTED], respectively.<sup>891</sup> Damages for a publisher in this matter are not equal to the entire amount of overcharge associated with each of their titles. In Section 8.4.2 above, I describe the concept of pass-through and estimate that publishers would pass between 20% and 25% of savings to consumers. The remaining portion of the overcharge by Valve, between 75% and 80%, reflects the actual harm to publishers.<sup>892</sup>

- (403) Below, I present a formula for computing the putative class members’ overcharges by Valve. The publishers’ overcharge is equal to the following equation, where  $i$  indicates publisher and  $j$  indicates product sold:

$$\text{Overcharge} = \sum_{i,j} \text{Revenue}_{i,j} \times (\text{Actual Commission Rate}_{i,j} - \text{But-For Commission Rate}_{i,j})$$

- (404) The total overcharge for the entire putative class is the sum of each member’s individualized overcharges, which reflect their sales volume for specific product offerings. Consequently, publishers with low sales volume are associated with low overcharge estimates. Commission rates can vary among the titles offered by an individual publisher based on Steam’s actual commission structure; this calculation necessarily considers an actual and but-for rate for each product sold.
- (405) Note that this overcharge calculation, and thus the associated damages calculation, is conservative, as it only accounts for the lower commission rate. This calculation does not consider the change in quantity of sales as a result of the lower commission rate (and resulting lower consumer price). As discussed in Section 4.2.2, the supracompetitive Steam commission fee is passed through to consumers in higher game prices, reducing the volume of purchases made. With a lower commission rate, and thus lower game prices to consumers, publishers would be able to sell more games, increasing revenues through higher volume in addition to savings on costs.

[REDACTED]

892 Note that I round these estimates here for simplicity. I use exact and unrounded results from my passthrough analysis in all calculations below. See: “04.Passthrough.R” and “05.Damages.R”.

## 8.5.2. Estimation of overcharge

### Sample calculation for Dark Catt

- (406) Dark Catt generated [REDACTED] in global revenue for its games since January 28, 2017, with a 30% commission rate to Valve over the same time period.<sup>893</sup> Using the calculation above, I calculate [REDACTED] in overcharge associated with its sales on Steam.<sup>894</sup> Because Dark Catt is a US-based publisher, I only calculate one global value.

### Sample calculation for Wolfire

- (407) Wolfire Games generated \$2.1 million between January 28, 2017 and December 31, 2022.<sup>895</sup> Assuming 2023 revenues are equal to those in 2022, I estimate that Wolfire Games, a US-based publisher, generated \$2.4 million in global revenues for its games between January 28, 2017 and December 31, 2023, with a 30% commission rate to Valve over the same time period.<sup>896</sup> Using the calculation above, I calculate [REDACTED] in overcharge associated with its sales on Steam.<sup>897</sup> Because Wolfire is a US-based publisher, I only calculate one global value.

### Sample calculation for all publishers

- (408) Between January 28, 2017 and December 31, 2022, I calculate that sales involving a U.S. publisher or foreign publisher with any US sales generated [REDACTED] in app sales and [REDACTED] of in-app revenue.<sup>898</sup> Assuming 2023 revenues are equal to those in 2022, I estimate an additional [REDACTED] and [REDACTED] in app sale and in-app revenues, respectively. At the varying individual commission rates determined using Valve’s transaction data, I calculate that the overcharge associated with these sales total to [REDACTED] and [REDACTED], respectively.<sup>899</sup>

(409) I also calculate overcharge for all global transactions. From January 28, 2017 through December 31, 2022, publishers on Steam generated [REDACTED] in app sales and [REDACTED] of in-app revenue globally.<sup>900</sup> Assuming revenues 2023 revenues are equal to those in 2022, I estimate an additional [REDACTED] and [REDACTED] in app sale and in-app revenues, respectively.<sup>901</sup> At the varying individual commission rates determined using Valve’s transaction data, I calculate that the overcharge associated with these sales total to [REDACTED] and [REDACTED] respectively.<sup>902</sup>

### 8.5.3. Estimation of damages

(410) For Dark Catt, I estimate damages to be between [REDACTED].<sup>903</sup> Similarly, for Wolfire Games, I estimate damages to be between [REDACTED].<sup>904</sup> For all publishers who are either based in the U.S. or have any sales with U.S. customers, I estimate damages to be between \$2.9 billion and \$3.1 billion.<sup>905</sup> See Figure 9 below.

## A. Economic Theory Appendix

### A.1. Boik and Corts analysis details

#### A.1.1. Introduction and overview

- (A1) In the body of the report, I calibrate the model to case-specific parameters. The model uses demand and cost parameters<sup>1</sup>  $a, b, d, x, c_1, c_2, c_s$  to determine prices, fees, and quantities with and without a PMFN on both platforms.<sup>2</sup> I determine a set of model parameters  $a, b, d, x, c_1, c_2, c_s$  that correspond to the case specific values for<sup>3</sup>  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1, c_2$ . I use the equations for my known values to solve algebraically for the unknown model parameters. In doing this, I show that the values for  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1$  identify a unique set of model parameters  $a, b, d, x, c_2, c_s$ .
- (A2) While this solution may suffice for some cases, as I discuss below, the case specific estimates give model parameters that imply seller profits are negative on Steam. This means that Steam’s profit maximization problem is not correct, since it is based on the assumption that sellers will sell on the platform; however, with negative economic profits, sellers would stop selling on Steam and instead pursue their next best alternative. This results in what is known as a “corner solution.” Rather than maximize their profits by setting marginal revenue equal to marginal costs, Steam would need to set its price at the highest level that still keeps the seller in the market. That is, they set their price at the point where the seller is just indifferent between selling on Steam and pursuing their next best alternative. I use the computer program R to calibrate the corner solution to the real-world estimates.

<sup>1</sup>  $a$  is the intercept in the demand for games.  $b$  is the coefficient on the price of a platform’s own games while  $d$  is the coefficient for the price on the other platform’s games.  $x$  is a demand parameter setting the difference in demand between Steam and EGS.  $c_1, c_2, c_s$  are constant marginal and average costs for Steam, ESG and the game developer respectively.

<sup>2</sup> For the full list of equations identified by the asymmetric Boik-Corts model, see:  
Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 133–134.

<sup>3</sup>  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1, c_2$ . Are prices, quantities, and fees with the PMFN in place for Steam and ESG respectably, and constant marginal and average costs for Steam and ESG.

### A.1.2. Interior solution

- (A3) To start we can invert the equations from the Boik and Corts model to provide model parameters that match specific observable outputs  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1$  for interior solutions of the model.

#### Solving the calibrated model (interior)

- (A4) First, I use the two demand functions  $q_1^2(\mathbf{P})$  and  $q_2^2(\mathbf{P})$ . I subtract the two equations to get  $x$  in terms of the known values  $p_1^2, p_2^2, q_1^2, q_2^2$  as well as  $b, d$ . When a PMFN is in place, it is required that  $p_1^2 = p_2^2$ , which allows for the  $b, d$  values to be eliminated from the equation giving the following.

$$q_1^2(\mathbf{P}) = a - p_1^2 b + p_2^2 d$$

$$q_2^2(\mathbf{P}) = a - x - p_2^2 b + p_1^2 d$$

$$q_1^2(\mathbf{P}) - q_2^2(\mathbf{P}) = x + b(p_2^2 - p_1^2) + d(p_2^2 - p_1^2)$$

$$\Rightarrow q_1^2(\mathbf{P}) - q_2^2(\mathbf{P}) = x$$

- (A5) Next, I use the implicit demand function  $q_1^2(\mathbf{f})$ , the standard demand function  $q_1^2(\mathbf{P})$ , and the equations for the optimal  $f_1^{2*}$  and  $f_2^{2*}$  from the asymmetric Boik-Corts model to determine values for  $(b - d)$ ,  $a, c_s, c_2$ .<sup>4</sup> With four equations I can determine these four unknown variables, but not  $b$  and  $d$  separately. These equations are the following.

$$(b - d) = \frac{-12q_1^2}{3(c_1 - f_1^2)}$$

$$a = q_1^2 + p_1^2(b - d)$$

$$c_s = \frac{x + 2a - (b - d)(f_1^2 + f_2^2) - 4q_1^2}{2(b - d)}$$

$$c_2 = \frac{3f_2^2(b - d) + 7x - 2a}{2(b - d)} + \frac{1}{2}c_1 + c_s$$

---

<sup>4</sup> Boik, Andre and Kenneth S. Corts (2016), "The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry," *The Journal of Law and Economics* 59(1): 105–134, at 133–134.

(A6) To derive these equations, I first use the demand function  $q_1^2(\mathbf{P})$  to get an equation for  $a$ .<sup>5</sup>

$$a = q_1^2 + p_i^2(b - d)$$

(A7) Next, I can derive an equation for  $c_s$  by rearranging the implicit demand function  $q_1^2(f)$ .

$$q_1^2 = \frac{1}{4} [2a + 2dc_s + d((f_1^2 + f_2^2)) - b(2c_s + f_1 + f_2) + x]$$

$$\Rightarrow 4q_1^2 - x - 2a + (b - d)((f_1^2 + f_2^2)) = -2c_s(b - d)$$

$$\Rightarrow c_s = \frac{x + 2a - (b - d)(f_1^2 + f_2^2) - 4q_1^2}{2(b - d)}$$

(A8) By rearranging the equations for  $f_1^2$  and  $f_2^2$ , I get the following pair of equations for  $c_2$ . First:

$$f_2^2 = \frac{2a + (b - d)(2c_1 - c_2 - 2c_s) + 5x}{3(b - d)}$$

$$\Rightarrow c_2 = 2(c_1 - c_s) - \frac{3f_1^2(b - d) - 5x - 2a}{b - d}$$

$$f_2^2 = \frac{2a + (b - d)(2c_2 - c_1 - 2c_s) - 7x}{3(b - d)}$$

$$\Rightarrow c_2 = \frac{3f_2^2(b - d) + 7x - 2a}{2(b - d)} + \frac{1}{2}c_1 + c_s$$

(A9) Now the two  $c_2$  equations can be set equal to one another to eliminate  $c_2$  from the equation and solve for  $c_s$  in terms of  $(b - d)$ .

$$\frac{3f_2^2(b - d) + 7x - 2a}{2(b - d)} + \frac{1}{2}c_1 + c_s = 2(c_1 - c_s) - \frac{3f_1^2(b - d) - 5x - 2a}{b - d}$$

$$\Rightarrow \frac{3f_2^2(b - d) + 7x - 2a}{2(b - d)} - \frac{3}{2}c_1 + \frac{3f_1^2(b - d) - 5x - 2a}{b - d} = -3c_s$$

$$\Rightarrow c_s = \frac{1}{2}c_1 - \frac{3f_2^2(b - d) + 7x - 2a}{6(b - d)} - \frac{3f_1^2(b - d) - 5x - 2a}{3(b - d)}$$

---

<sup>5</sup> I use that  $p_1^2 = p_2^2$ . The PMFN forces these prices to be equal.

(A10) Next, I set this equation for  $c_s$  equal to the previous equation for  $c_s$  above to get an equation for  $(b - d)$  using only my known values identified above.

$$\frac{1}{2}c_1 - \frac{3f_2^2(b-d) + 7x - 2a}{6(b-d)} - \frac{3f_1^2(b-d) - 5x - 2a}{3(b-d)} = \frac{x + 2a - (b-d)(f_1^2 + f_2^2) - 4q_1^2}{2(b-d)}$$

(A11) Multiply both sides by  $6(b - d)$  to get:

$$\Rightarrow 3c_1(b-d) - 3f_2^2(b-d) - 7x + 2a - 6f_1^2(b-d) + 10x + 4a = 3x + 6a - 3(b-d)(f_1^2 + f_2^2) - 12q_1^2$$

$$\Rightarrow (b-d)(3c_1 - 3f_1^2) = -12q_1^2$$

$$\Rightarrow (b-d) = \frac{-12q_1^2}{3(c_1 - f_1^2)}$$

(A12) Now that I have a value for  $(b - d)$  I can use my equation for  $a$  above to solve for  $a$ .

$$a = q_1^2 + p_i^2(b-d)$$

(A13) With  $(b - d)$  and  $a$  I can now plug in all the values from my equation for  $c_s$  above.

$$c_s = \frac{x + 2a - (b-d)(f_1^2 + f_2^2) - 4q_1^2}{2(b-d)}$$

(A14) Finally, plugging all of these values into either equation for  $c_2$  will give  $c_2$ .

$$c_2 = \frac{3f_2^2(b-d) + 7x - 2a}{2(b-d)} + \frac{1}{2}c_1 + c_s$$

(A15) The final step is to identify  $b$  individually from the  $b - d$  value above. However, as I show below, any value for  $b$  will result in negative seller profits across both platforms with the PMFN in place. The seller profits are a function of the prices and quantities with the PMFN (which I am fixing at the real values), and the seller costs. As I show above, the seller costs are a function of the prices and quantities with the PMFN and firm 1's costs, which again are fixed to real world values. So, the seller's total profits are fixed by the real-world values. This is shown below by plugging the corresponding equations for  $c_s$ ,  $a$ , and  $(b - d)$  from above into the seller profit functions.

$$\begin{aligned}\Pi_{s1}^2 &= (p_i^2 - f_1^2 - c_s)(q_1^2) \\ &= \left( p_i^2 - f_1^2 - \frac{x + 2a - (b-d)(f_1^2 + f_2^2) - 4q_1^2}{2(b-d)} \right) (q_1^2)\end{aligned}$$

$$= \left( p_i^2 - f_1^2 - \frac{x + 2(q_1^2 + p_i^2 \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right)) - \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right) (f_1^2 + f_2^2) - 4q_1^2}{2 \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right)} \right) (q_1^2)$$

$$\Pi_{s2}^2 = \left( p_i^2 - f_2^2 - \frac{x + 2(q_1^2 + p_i^2 \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right)) - \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right) (f_1^2 + f_2^2) - 4q_1^2}{2 \left( \frac{-12q_1^2}{3(c_1 - f_1^2)} \right)} \right) (q_2^2)$$

(A16) To further illustrate this point, I show the calculated seller profits for a range of  $b$  values.<sup>6</sup>

**Figure A.1: Interior Solution Seller Profits**

(A17) As the figure shows, the combined seller economic profits on both platforms when the PMFN is in place are negative. This indicates that sellers with these costs facing these prices and

<sup>6</sup> See 09a\_interior.R

fees would choose not to sell at all over operating in this market. The model can be adjusted to reflect how Steam and the seller would adjust their behavior in this situation.

### A.1.3. Corner solution

(A18) In the above scenario, sellers would exit the market or sell just on EGS. To avoid this, Steam would lower their fees until sellers are just indifferent between selling on Steam and their next best option. What their next best option is depends on the demand parameters of the model. One option the seller has is to exit the market entirely and pursue their next best option, earning zero economic profits (the definition of zero economic profits is the profits at the firm’s next best option). The second option is to avoid the PMFN by selling only to EGS. This may seem like an attractive option; however, it would mean the seller sells to the other platform as a (now) monopolist. This option would give them whatever economic profits they can acquire with the competing firm’s demand curve and the competing firm acting as a monopolist. I denote these profits  $\Pi_s^m$ .

(A19) To find the solution, then, Steam lowers their fee until the seller’s total economic profits across both platforms are equal to  $\Pi_s^m$ . To do this, we must first determine  $\Pi_s^m$ .

### Monopoly profits

(A20) As discussed in appendix B of the Boik and Corts paper, the model is somewhat ambiguous as to what demand would look like with only one firm.<sup>7</sup> To solve this problem, I consider a range of potential demand equations for game sales on the competing platform, EGS, if the seller chose to sell only on EGS. The demand for games on EGS in this case demand takes the following form where  $m$  denotes the monopoly outcome and  $A$  and  $M$  are constants.

$$\Rightarrow q_2^m = A - Mp_2^m$$

(A21) And this gives the seller profits of

$$\Pi_s^m = (p_2^m - f_2^m - c_s)(A - Mp_2^m)$$

(A22) Take the first order condition with respect to the seller’s price and setting it equal to zero gives the following.

---

<sup>7</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 131–132.

$$\frac{\partial \Pi_s^m}{\partial p} = A - 2Mp_2^m + f_2^m M + c_s M = 0$$

$$\Rightarrow A + f_2^m M + c_s M = 2Mp_2^m$$

$$\Rightarrow \frac{A}{2M} + \frac{f_2^m}{2} + \frac{c_s}{2} = p_2^{m*}$$

(A23) This is the seller’s optimal price if they only sold games through EGS. Now plugging this into the platform’s profit condition and maximizing with respect to the fee gives the optimal EGS monopoly fee.

$$\Pi_2^m = (f_2^m - c_2) \left( A - M \left( \frac{A}{2M} + \frac{f_2^m}{2} + \frac{c_s}{2} \right) \right)$$

$$\frac{\partial \Pi_2^m}{\partial f_2^m} = \frac{A}{2} - Mf_2^m - \frac{1}{2}Mc_s + \frac{1}{2}c_2M = 0$$

$$\Rightarrow f_2^{m*} = \frac{1}{2}(c_2 - c_s) + \frac{A}{2M}$$

(A24) Note that these solutions only work if it’s possible to earn a profit. If the sum of the costs are not below the choke price,  $c_s + c_2 < \frac{A}{M}$ , the seller and platform cannot price high enough to cover their costs. So, in this case, the seller cannot sell to the second platform as a monopolist and their next best option is to exit the market. This inequality comes from two limits to the monopoly price. The price cannot be above  $A/M$  as this would push the market quantity below zero (one can see this by plugging  $A/M$  into the monopoly demand curve above). Alternatively, if the price is below  $c_2 + c_s$  the seller and the platform cannot collectively cover their costs. So, if  $c_2 + c_s > \frac{A}{M}$  then the lowest possible price is above the highest possible price and there is no working monopoly price. In this case, the seller’s only option outside abiding by Steam’s PMFN is to exit the market and earn zero economic profits.

(A25) To determine a range for the competing platform’s demand in the event they are the only seller, I consider two different approaches. First, I assume the competitor platform would capture the maximum amount of demand from Steam, and I set the price of the firm that exited the market (in this case Steam) to a level such that their demand is equal to zero. A price so high no one would choose to purchase on Steam is effectively the same as Steam not being available. This provides a reasonable upper bound on demand. That is, I set:

$$p_1^m = \frac{a + dp_2^m}{b}$$

(A26) Now this gives the following equation for demand on platform 2.

$$q_2^m = a - bp_2^m + d \left( \frac{a + dp_2^m}{b} \right) - x$$

$$\Rightarrow q_2^m = a + \frac{da}{b} - x - \left( b - \frac{d^2}{b} \right) p_2^m$$

(A27) With:

$$A = a + \frac{da}{b} - x$$

$$M = \left( b - \frac{d^2}{b} \right)$$

(A28) Alternatively, I can assume that the seller exiting Steam would be equivalent to Steam setting their price to zero (the lowest possible price). This provides a reasonable lower range estimate of the monopolist platform’s demand.

$$q_2^m = a - x - bp_2^m$$

$$A = a - x$$

$$M = b$$

### Corner solution derivation

(A29) To derive the corner solution, I use the nloptr function from the nloptr package in the statistical program R (version 4.3.1).<sup>8</sup> Overall, a solution is found by minimizing the sum of the squared difference between the results generated from a given set of model parameters,  $a, b, d, x, c_1, c_2, c_s$ , and the real world values  $p_1^2, p_2^2, q_1^2, q_2^2, f_1^2, f_2^2, c_1, c_2$ . To generate a set of results for a given set of model parameters, the following process is used.

---

<sup>8</sup> See the files, 00\_BC\_header.R, 09c\_corner\_hd.R, 09c\_corner\_ld.R.

(A30) First, I check the interior solution outlined above. Then, I check if the seller would actually continue to sell on Steam with the given interior solution, i.e., is the seller earning more profits across both platforms than  $\Pi_s^m$ ? If not, I calculate the corner solution. For the corner solution, I again use the nloptr function to search for the optimal Steam fee such that seller profits across both platforms are just equal to  $\Pi_s^m$ . To do this, the program searches over Steam fee values  $f_1^2$  and computes the competitor’s fee  $f_2^2$  using EGS’s best response function (which determines their optimal fee given Steam’s fee). ESG’s best response function can be found by maximizing their profit function taking Steam’s fee as given (as it will be given in the search algorithm).

$$\begin{aligned}\Pi_2^2 &= (f_2^2 - c_2)(a - (b - d)p_i^2 - x) \\ &= (f_2^2 - c_2)\left(a - (b - d)\frac{2a + (b - d)(2c_s + f_1^2 + f_2^2) - x}{4(b - d)} - x\right) \\ &= (f_2^2 - c_2)\left(\frac{1}{2}a - \frac{1}{4}(b - d)(2c_s + f_1^2 + f_2^2) - \frac{3}{4}x\right) \\ \Rightarrow \frac{\partial \Pi_2^2}{\partial f_2^2} &= \frac{1}{2}a - \frac{1}{4}(b - d)(2c_s + f_1^2 + 2f_2^2) - \frac{3}{4}x + c_2\frac{1}{4}(b - d) = 0 \\ \Rightarrow f_2^{2BR} &= \frac{a}{b - d} - c_s - \frac{1}{2}f_1^2 - \frac{3x}{2(b - d)} + \frac{1}{2}c_2\end{aligned}$$

(A31) Using the values of  $f_1^2$  and  $f_2^2$  that satisfy this corner solution condition, I update the values for the prices and quantities in the PMFN case by using the equations from the Boik and Corts paper for the prices and quantities that are determined by the seller’s optimal pricing problem.<sup>9</sup> To summarize, this process gives model outputs that satisfy the corner solution condition, that is, the seller is willing to stay in the market and sell on both platforms, for a given set of inputs. The nloptr function uses this process to search over model parameters until the sum of the squared difference between the real-world values and the values of the model produced are minimized.

## Results

(A34) In both cases, developers are harmed by the PMFN. The PMFN allows Steam to raise their commission while simultaneously increasing their market share by forcing developers to price

<sup>10</sup> Note that the model is calibrated with  $p_i^2 = 1$  and  $q_1^2 + q_2^2 = 1$  for better performance. The results from these parameters can be scaled according to the real-world units as seen in 10\_BC\_tables.R.

evenly across platforms. Note that the second, “High ESG Monopoly Demand Model” is not able to fit the facts of the case as well. The prices, fees, and quantities are further from the real-world values. Additionally, it assumes the seller would see a large boost in demand at EGS should the seller remove their game from Steam. I have no reason to think this is reflective of the typical seller experience. As such, I present the “Low ESG Monopoly Demand Model” in the report.

## **A.2. Analytic approach algebraic details**

(A35) To come to a but-for price, I rely on real-world values for platform fees, costs, and market share; a calculation of the but-for market share; and conclusions drawn from the Landes and Posner model (which are reinforced by the Boik-Corts model). As before, I assume Steam’s firm demand is linear. Figure 1 illustrates Steam’s firm demand in the real world and indicates the but-for quantity. Steam’s but-for demand must shift such that Steam’s profit maximizing optimal equilibrium point is at the but-for quantity. In other words, the new curve must shift such that the but-for price and but-for quantity satisfy the Lerner Index.<sup>11</sup> In addition, I conservatively assume that the slope of the demand curve remains constant. Figure 2 illustrates the change, and the following section walks through the calculations that determine the exact values.

---

<sup>11</sup> It is equivalent to think of this in terms of either the profit maximization point or the satisfaction of the Lerner Index because the Lerner Index is derived from the profit maximization condition. A firm’s profit-maximizing price is established when the firm sets its marginal revenue equal to marginal cost. See:

Landes, William M. and Richard A. Posner (1981), “Market Power in Antitrust Cases,” *Harvard Law Review* 94(5): 937–996, at 984–986.

**Figure A.2: Steam Demand and But-For Quantity**

**Figure A.3: Steam Demand and But-For Quantity**

(A36) Steam’s real-world price, quantity, marginal costs and but-for quantities  $P^{rw}$ ,  $Q^{rw}$ ,  $C'$ ,  $Q^{bf}$  are all known or bounded as described in Section 8.3. Using these known values, I am able to determine an upper bound of Steam’s but-for markup (thus, price). As I will show below, this but for markup is determined by the following equation.

$$(P^{bf} - C') = \frac{Q^{bf}}{Q^{rw}}(P^{rw} - C')$$

(A37) First, recall that the but-for price must satisfy the Lerner Index. The Lerner Index equals the inverse of the but-for elasticity, which is a function of the but-for price and quantity:

$$\frac{(P^{bf} - C')}{P^{bf}} = \frac{1}{\epsilon_i^d(P^{bf}, Q^{bf})}$$

(A38) Demand elasticity is defined as the following:

$$\epsilon_m^d = -\frac{P}{Q} \frac{\partial Q}{\partial P}$$

(A39) As discussed in 8.3.2, I assume that demand is linear, which implies that  $-\frac{\partial Q}{\partial P} = m$ , where  $m$  is a constant. Substituting this into the equation for demand elasticity gives the following:

$$\epsilon_i^d(P, Q) = m \frac{P}{Q}$$

(A40) Next, substituting the above equation for elasticity into the but-for Lerner Index results in the following:

$$\frac{(P^{bf} - C')}{P^{bf}} = \frac{1}{\epsilon_i^d(P^{bf}, Q^{bf})} = \frac{1}{m \frac{P^{bf}}{Q^{bf}}}$$

(A41) This is rearranged and simplified to the following:

$$(P^{bf} - C') = \frac{Q^{bf}}{m}$$

(A42) This resulting equation provides the but-for markup as a function of the cost, but-for quantity, and  $m$ . I derive  $m$  using real-world values and the relationship between Steam’s elasticity and the Lerner Index. Because I assume that the slope of the demand curve does not change between the actual and but-for worlds,  $m$  is fixed between the real world and but-for world ( $m$  is the negative inverse of the slope of demand). The value of  $m$  is derived below:

$$m = \epsilon_i^d(P^{rw}, Q^{rw}) \frac{Q^{rw}}{P^{rw}} = \frac{P^{rw}}{(P^{rw} - C')} \frac{Q^{rw}}{P^{rw}} = \frac{Q^{rw}}{P^{rw} - C'}$$

(A43) Replacing  $m$  with these known values in the but-for markup equation results in the following:

$$(P^{bf} - C') = \frac{Q^{bf}}{Q^{rw}} (P^0 - C')$$

$$P^{bf} = \frac{Q^{bf}}{Q^{rw}} (P^0 - C') + C'$$

(A44) In the section that follows, I calculate the values on the right-hand side of this equation and determine the but-for price.

### A.3. Lerner Index and Boik and Corts equivalence

(A45) To address any concern that the Lerner Index may not apply in the platform setting, I show below that the Lerner Index holds in the Boik and Corts model, which is specifically formulated to address platforms.<sup>12</sup>

(A46) In Appendix A.1 I show that the asymmetric Boik and Corts model implies the following.

$$(b - d) = \frac{-12q_1^2}{3(c_1 - f_1^2)}$$

(A47) We also know, as shown in Section 7.2.1 of the report, the following.

$$\epsilon_1^2(f) = \frac{b - d}{4} \frac{f_1^2}{q_1^2}$$

(A48) Plugging the value of  $(b - d)$  into this equation gives:

$$(b - d) = \frac{-12q_1^2}{3(c_1 - f_1^2)}$$

---

<sup>12</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 105.

$$\epsilon_1^d(f) = \frac{b - d f_1^2}{4 q_1^2}$$

$$\Rightarrow \epsilon_1^d(f) = \frac{\frac{-12q_1^2}{3(c_1 - f_1^2)} f_1^2}{4 q_1^2} = \frac{-f_1^2}{c_1 - f_1^2} = \frac{f_1^2}{f_1^2 - c_1} \Rightarrow \frac{f_1^2 - c_1}{f_1^2} = \frac{1}{\epsilon_1^d(f)} = L$$

(A49) This is the Lerner Index.

## A.4. Boik and Corts modification to analytic approach

### A.4.1. Overview

(A50) The Boik and Corts model gives a lower bound for the change in the slope of demand that results from removing the PMFN. I utilize this bound to illustrate the impact of adjusting the slope of demand, rather than holding it fixed as I do in my main analysis.

### A.4.2. Defining terms and general equations

(A51) The notation here is borrowed from Boik and Corts and so is different from the notation in the analytic approach. To start, I re-define some key terms from that model.<sup>13</sup>

- $f_i$  are platform fees for Steam or competitors. (Steam is  $i = 1$  and competitor is  $i = 2$ )
  - Throughout the analysis I assume competitor’s fees are unchanged from the real world and the but-for world.
- $p_i$  is the price of the games on platform  $i$ .
- $f_1^{bf}$  is Steam's but-for price. This is what I want to determine.
- $f_1^{rw} = \blacksquare$  is Steam's real-world price.
- $q_1^{bf} = \blacksquare$  is the but-for quantity with no PMFN.
- $q_1^{rw} = \blacksquare$  is the real-world quantity with 2 PMFNs (the paper shows why I can assume 2 PMFNs even though only Steam has one).<sup>14</sup>

---

<sup>13</sup> For Steam’s commission rate of  $\blacksquare$  see Valve Transaction Data, 1/28/2017–12/31/2022. See: “06\_Damages.R”  
 For Steams costs of  $\blacksquare$  See Attachment D-7.  
 For Steams market share of  $\blacksquare$  see Attachment E-1.  
 For Steams but-for share of  $\blacksquare$  see Section 8.3.4.

<sup>14</sup> Boik, Andre and Kenneth S. Corts (2016), “The Effects of Platform Most-Favored-Nation Clauses on Competition and Entry,” *The Journal of Law and Economics* 59(1): 105–134, at 123. “[T]he entrant either adopts a PMFN agreement along with the incumbent or is asymmetric enough that the fee-setting equilibrium behaves as if there are two PMFN agreements.”

- $C' = \blacksquare$  is Steam's marginal cost.
- $\epsilon_1^0(f_1, q_1)$  is Steam's elasticity of demand without PMFNs in place (zero PMFNs).

(A52) Additionally, the implicit demand functions are the following.

$$q_1^0(f) = \frac{1}{2}[a - b(c_s + f_1) + d(c_s + f_2)]$$

$$q_1^2(f) = \frac{1}{4}[2a + dc_s + d(f_1 + f_2) - b(2c_s + f_1 + f_2) + x]$$

### A.4.3. Results and proof

(A53) The main takeaway is that the but-for markup over cost is bounded by the following inequality.

#### Result

$$f_1^{bf} - C' = \frac{q_1^{bf}}{-\frac{\partial q_1^0(f)}{\partial f_1}} = \frac{q_1^{bf}}{\frac{1}{2}b} < \frac{q_1^{bf}}{\frac{1}{2}(b-d)} = \frac{1}{2} \frac{q_1^{bf}}{q_1^{rw}} (f_1^{rw} - C')$$

$$\Rightarrow f_1^{bf} - C' < \frac{\blacksquare}{\blacksquare} \frac{\blacksquare}{\blacksquare} \frac{\blacksquare}{\blacksquare} \frac{\blacksquare}{\blacksquare} \quad 15$$

$$\Rightarrow f_1^{bf} < \blacksquare$$

(A54) This gives an upper bound on the but-for fee for Steam of  $\blacksquare$ .

#### Proof

(A55) The first equality follows from the Lerner Index and the definition of the firm elasticity to get the following.

$$\frac{f_1^{bf} - C'}{f_1^{bf}} = \frac{1}{\epsilon_1^0(f_1^{bf}, q_1^{bf})} = \frac{1}{-\frac{f_1^{bf}}{q_1^{bf}} \frac{\partial q_1^0(f)}{\partial f_1}}$$

---

<sup>15</sup> For Steam's commission rate of  $\blacksquare$  see Valve Transaction Data, 1/28/2017–12/31/2022. See: "06\_Damages.R"  
For Steam's costs of  $\blacksquare$  See Attachment D-7.  
For Steam's market share of  $\blacksquare$  see Attachment E-1.  
For Steam's but-for share of  $\blacksquare$  see Section 8.3.4.

(A56) Canceling and rearranging gives:

$$f_1^{bf} - C' = \frac{q_1^{bf}}{-\frac{\partial q_1^0(f)}{\partial f_1}}$$

(A57) The next equality comes from the derivative of the  $q_1^0(f)$  equation from Boik and Corts shown above.

$$\frac{\partial q_1^0(f)}{\partial f_1} = -b \frac{1}{2}$$

(A58) Next, the inequality holds because the term on the right is subtracting  $d$  from  $b$  in the denominator. Since  $b, d > 0$  and  $b > d$ ,<sup>16</sup> the denominator is still positive, but is smaller than  $b$  alone. A smaller denominator makes the whole term on the right larger.

(A59) The last equality comes from two equations. First, we take the derivative of the  $q_1^2(f)$  function from Boik and Corts (shown above).

$$\frac{\partial q_1^2(f)}{\partial f_1} = -\frac{1}{4}(b - d)$$

(A60) Now using the Lerner Index we can get the same derivative as a function of the real-world markup and quantity, giving:

$$\frac{\partial q_1^2(f)}{\partial f_1} = -\frac{q_1^{rw}}{f_1^{rw} - C'}$$

(A61) Putting these together gives the following, which proves the second to last equality.

$$(b - d) = 4 \frac{q_1^{rw}}{f_1^{rw} - C'}$$

(A62) The last equality comes from plugging in our known values listed above.

### B.1. Valve productions

(A63) I use three major data productions from Valve in my report:

- Between March 31, 2023 and April 3, 2023, Valve produced several comma-separated values (CSV) files and spreadsheets in response to Requests for Production Nos. 62, 64-66, and 69-70. As in the associated letters and documentation, I refer to these data and associated tables in subsequent productions collectively as “Valve Transaction Data.”<sup>17</sup>
- On June 2, 2023, Valve produced several CSVs and spreadsheets to supplement their response to the RFPs noted above.<sup>18</sup> I refer to this production as “Partner Payments.”
- On July 30, 2023, I received an additional production in response to RFP No. 76 containing lookup tables with information on app genre and tags, among others. I refer to this and similar lookup tables in the previous productions as “Lookup Tables.”

(A64) All relevant productions from Valve were uploaded to BigQuery, a secure data warehouse part of the Google Cloud environment. BigQuery’s servers were used to store the source data, and its SQL functionality was used to combine source data to create intermediate tables.<sup>19</sup> I outline both steps below. Additional information on this storage and all programming scripts used are available in my backup materials.

#### B.1.1. Data storage (BigQuery)

(A65) The table below maps how files produced by Valve in this litigation were stored on BigQuery. The scripts I produced with my report reference the tables name in the column “BigQuery Location,” which are part of a schema called “source\_data.” These source files are referenced in the SQL script in my backup materials as “source\_data.[BigQuery Location].”

### B.1.2. Data manipulation (BigQuery)

(A66) I’ve included all Structured Query Language (SQL) queries used to manipulate Valve’s production in the production of my backup materials. These queries are used to create a final analysis table. This final table and all intermediate working tables belong to the schema ‘Schwartz\_Production’; this schema is produced via a physical hard drive. For convenience, I summarize these processes at a high level below.

(A67) In this matter, Valve produced two main tables containing daily transaction records: [REDACTED]. The former, which I refer to as “package” data, reflects saleable units available on Steam’s store. The latter, which I refer to as “in-app” or “in-game” data, reflects revenues recorded as in-game transactions. The package data reflect daily transactions at the package level.<sup>20</sup> The in-game data reflect daily transactions at the app level.<sup>21</sup>

#### Combining tables

(A68) Records from the packages and in-game tables were appended to create one table containing both revenue sources provided. I describe below the fields joined onto each table from translation tables before appending.

(A69) [REDACTED]  
[REDACTED]. Partner countries can change over time, and these dates are considered when joining to the transaction records. In addition, translation tables were used to decode [REDACTED] (both tables) and [REDACTED] (package table only).

(A70) [REDACTED]  
[REDACTED] Using the app translation provided by this table, genres, Steam categories, and revenue share transition dates were added to both the package and in-game tables.

---

<sup>20</sup> Packages, which are identified by a PackageID, map to saleable units like base game, a special edition, or certain downloadable content. Several packages can belong to an app, identified by an AppID. For instance, [REDACTED] and [REDACTED] are associated with the same [REDACTED]

Records in the packages data are not uniquely identified by PackageID and date of sale alone. Features of a transaction such as [REDACTED], et c. are also identified in the records.

<sup>21</sup> All in-game revenue for [REDACTED] is aggregated and cannot be mapped to an individual package.

(A71) Descriptions for [REDACTED]  
[REDACTED] level, respectively. Of these, only AppID is relevant for the in-app records.

### Intermediate tables

(A72) Several intermediate tables are used in the manipulation of these data on BigQuery. In the scripts and data I produce, each of these tables belongs to the schema “SchwartzProduction.” I describe these tables below.

### Creating fields

(A73) Through the course of creating one table to underpin the analyses in my report, several fields were created.

- Year – Transaction year, extracted from [REDACTED]
- Month – Transaction month, extracted from [REDACTED]
- Calculated\_Take\_Rate – Commission rate, calculated as  $1 - \frac{[REDACTED]}{[REDACTED]}$
- Correct\_Payment – True when contracted rates match partner payments to Valve
- Zero\_Sales\_Flag – True when [REDACTED] is 0
- No\_Payment\_Flag – True when [REDACTED] is NULL
- Small\_Sales\_Flag – True when absolute value of [REDACTED] is below \$1
- Base\_Game\_Flag – See flagging criteria above.
- App\_Package\_SameName – True when a package and app description are equal.

### Modifying records

(A74) For records from the in-app table, [REDACTED]  
[REDACTED] are assigned a value of -1.

### B.1.3. Data manipulation (R)

(A75) After storing and combining these productions using BigQuery to create a main table for analysis, the R package bigrquery was used for subsequent querying and analysis. Bigrquery is an Application Programming Interface (API) that allows users to connect to BigQuery from RStudio.<sup>22</sup> R version 4.3.1 was used, and analysis was carried out using functions available within the package collection tidyverse.<sup>23</sup> I include all packages used through this local

<sup>22</sup> DBI for R, Bigrquery, <https://bigrquery.r-dbi.org/> (accessed 2/8/2024).

<sup>23</sup> Tidyverse, Tidyverse packages, <https://www.tidyverse.org/> (accessed 2/8/2024).

processing in the file “00\_Header.R” in my backup materials. For analyses in which I generate tables found in the G section of my report’s attachments, assumptions and filtering are included in the notes below each table. Additionally, all filtering can be found in the scripts included in my backup materials.

(A76) When collapsing data for analysis in my report involving passthrough of sale prices, records were limited to those for US customers with transactions in US dollars. Additionally, I remove sales that took place as part of bundles, remove games published by Valve, filter records to base games, and limit to games with an AppType of 1 (playable game).<sup>24</sup> I then aggregate the data to the date and package level. Given sale prices can vary within a day (usually due to sale periods or delayed returns), I calculate a quantity-weighted average sale price.<sup>25</sup>

(A77) Though most flagging and fields were created in BigQuery, a few additional fields were generated in R for this analysis, including:

- days\_since\_tier1 – a running tally of days since a game crossed into the 25% commission threshold.
- obs\_360\_days - identifies if the game package has at least 50% of the daily pricing data available in the 720-day time window around crossing the Tier 1 threshold.

(A78) For other analyses, assumptions and filtering are included in the notes in each attachment. Additionally, all filtering can be found in the scripts included in my backup materials.

---

<sup>24</sup> See table EAppType (VALVE\_ANT0753570).

<sup>25</sup> This calculated price weights quantities only using records with net positive transactions and revenues. For instance, if a package had two recorded sale prices on 1/1/2020, but one was only associated with returns from previous sales, I do not consider the previous sale price in my calculation.

### **Steven Schwartz, Ph.D.**

*Managing Director*

Dr. Steven Schwartz is a Managing Director at Intensity, a Secretariat Company. With extensive experience in economic consulting, he has been retained as an economic expert in numerous litigation and non-litigation matters and has provided testimony before the U.S. International Trade Commission and the U.S. Tax Court, federal and state courts.

Dr. Schwartz has over 35 years of economic consulting experience and has applied his expertise in high-stakes disputes related to commercial success, irreparable harm, lost profits, reasonable royalties, economic domestic industry considerations, and unjust enrichment. His areas of expertise include:

- Antitrust and Competition
- Intellectual Property Damages and Valuation
- Damages Assessment in Complex Commercial Disputes
- Class Certification
- Securities and Finance Litigation

Examples of Dr. Schwartz work include:

- Analysis of pricing behavior by a company that pled guilty to price fixing as a part of a larger conspiracy to determine the impact on the firm and to assess the portion of its price increases attributable to the conspiracy as opposed to non-collusive factors such as cost increases.
- Assessment to the damages suffered by a residential home builder and land developer as a result of alleged breaches of contracts and fraud by another home builder. The analysis included a determination of the number of homes the Plaintiff would have built and sold in the absence of the alleged breaches and fraud, as well as the losses the firm would incur as it attempted to re-enter the market, post-fraud.
- Analysis of the commercial success of a branded drug in the context of a Hatch-Waxman dispute; the branded drug was a late entrant into the market, i.e., after the entry of competitors selling generic versions of first and second-generation drugs, and Dr. Schwartz provided an assessment of the drug's performance and success in the context of a market dominated by generic competitors.
- Analyzed the damages suffered by an aircraft manufacturer as a result of a patent infringement by a rival manufacturer of a component of the aircraft at issue. The royalty analysis considered the appropriate royalty in a case in which the infringing product was never sold.

Dr. Schwartz's consulting background spans many industries, such as hospitality, consumer goods, electronics, gaming, and pharmaceuticals, among others. He has also consulted in a variety of business, valuation and strategic planning issues.

[H] Discord closed Discord Store in March 2019 and replaced it with its Nitro game catalogue as part of Nitro subscription service, which also

was closed in September 2019. In March 2019, Discord introduced a new version of its verified servers that would allow developers

"to create a dedicated store channel within their own server where players can purchase their titles." However, Discord later announced that after March 2022, it would sunset its store channel functionality, removing developers' "store channels and the ability to sell game [] on Discord[.]" See:

This is inclusive of GOG Galaxy sales, as well as GOG.com sales. See:

CD Projekt, Consolidated Financial Statement, 2021, at 28.

[G]–[I]:

For 2018 and 2019, See Attachment E-7 for the relevant platform and year.

For 2017 and 2020–2021, I conservatively assume sales in the amount of the maximum value from Attachment E-7 for the relevant platform.

[J] = Attachment E-8 at [C] for the relevant year.

[K] See discussion in Class Certification Report of Steven Schwartz, Ph.D., 2/8/2024, at § 4.2.3.

[L] Discord only operated a third-party store from 2018–2019 and third-party sales are de minimis. See Discussion in Class Certification Report of Steven Schwartz, Ph.D., 1/26/2024, at § 4.2.3.

[M] Itch.io third-party sales are de minimis. See Discussion in Class Certification Report of Steven Schwartz, Ph.D., 1/26/2024, at § 4.2.3.

[N] Sum of [A]–[M].

[O] = [B] / Sum of [A] – [M].

I only calculate total share for Epic from 2019–2021, as 2017 was null and 2018 represents a partial year.

[P] = [A] / Sum of [A]–[M].

Total = Sum of preceding columns.

## Third-Party PC Market Share Data for Select Participants, 2018–2019

Platform	Source	2018	2019
Ubisoft	[A]	\$ 90,000,000	\$ 130,000,000
Green Man Gaming	[B]	\$ 52,000,000	\$ 52,000,000
GOG	[C]	\$ 34,000,000	\$ 34,000,000
Gamersgate	[D]	\$ 8,000,000	\$ 7,497,000

*Notes and sources:*

[A]–[D] Epic, "Presentation to the Board of Directors," 8/13/2019 (EPIC\_VALVE\_0000364–389, at EPIC\_VALVE\_0000369).

[D] For 2019, I multiply the total market size by Gamersgate's percentage share of 1.7%.

I understand these revenues to represent third-party PC sales only. For example, this presentation suggests that Epic's expected 2019 sales were \$211 million. Using Epic's publicly-released year-in-review, Epic's actual third-party sales were in the amount of \$251 million, whereas total spend in the Epic Games Store including first-party sales was \$680 million. Thus, I understand this data to represent third-party sales only. See:

Epic Games Store, "Epic Games Store Weekly Free Games in 2020!" 1/14/2020, <https://store.epicgames.com/en-US/news/epic-games-store-weekly-free-games-in-2020>.

## Microsoft PC Third-Party Revenue, 2017–2021

Microsoft PC third-party total sales	[C]	\$ [REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]

*Notes and sources:*

[A] = Sum of Attachment X-4 at relevant year if Super Division = EDG Managed - Gaming 3P Content, Product Division = 3P Gaming Transactions or 3rd Party Games, and Business Unit = Windows Gaming.

[B] = Sum of Attachment X-5 at relevant year if Super Division = EDG Managed - Gaming 3P Content, Product Division = 3P Gaming Transactions or 3rd Party Games, and Business Unit = Windows Gaming.

[C] = [A] + [B].

Note that this includes Windows 3PP Season Pass, which likely resembles a subscription service, and should not be included in the relevant market, and thus this figure overstates actual third-party sales.

See Attachment X-4 at Product Unit.

I note that Microsoft's fiscal year (July 1 to June 30) differs from calendar year revenues. For sake of simplicity, I assume Microsoft's sales map directly to a calendar year.

See Microsoft, Form 10-K, 2022, at 1.

		2023		
		Total		

*Notes and sources:*

Records are limited to transactions for non-Valve publishers that took place on or after January 28, 2017. Hardware sales and records with unknown app types are removed.

[A] Global (Foreign Exclusion) removes publishers who are not based in the US and have no US sales during the damages period.

[B] In-App denotes transactions from Valve's In-App data, and Package denotes transactions from Valve's Package data. See: Valve Transaction Data.

[C] Records in Valve Transaction Data end on December 31, 2022. 2023 values are assumed to be equal to 2022. Total reflects a sum through 12/31/23 including this assumption.

[D] See: Valve Transaction Data.

[E] Overcharge reflects transaction revenues multiplied by the overcharge rate determined for each commission rate.

Overcharge rate = Calculated Commission Rate - ((But-For Commission Rate × Calculated Commission Rate) / Effective Commission Rate).

The remaining revenue is associated with outlier commission rates calculations, due to timing of partner payments or small transaction size.

When calculating overcharges, I floor rates below 20% at 20% and cap rates above 30% at 30%.

For calculated commission rates where an AppID had net negative revenues, that rate is dropped from the overcharge calculation.

See "05\_Damages.R."

[B] Sum of In-App Revenue and Package Revenue. [REDACTED]

See Valve Transaction Data.

[C] Records in Valve Transaction Data end on December 31, 2022. 2023 values are assumed to be equal to 2022.

[D] Total reflects a sum for revenues for 1/28/2017–12/31/2023 including assumption that 2023 revenues are equal to 2022.

[E] Overcharge reflects transaction revenues multiplied by the overcharge rate determined for each commission rate.

Overcharge rate = Calculated Commission Rate - ((But-For Commission Rate × Calculated Commission Rate) / Effective Commission Rate).
